Chapter 1

ModbusLib

1.0.1 Overview

ModbusLib is a free, open-source [Modbus](#) library written in C++. It implements client and server functions for TCP, RTU and ASCII versions of [Modbus](#) Protocol. It has interface for C language (implements in [cModbus.h](#) header file). Also it has optional wrapper to use with Qt (implements in [ModbusQt.h](#) header file). Library can work in both blocking and non-blocking mode.

Library implements such [Modbus](#) functions as:

- 1 (0x01) - READ_COILS
- 2 (0x02) - READ_DISCRETE_INPUTS
- 3 (0x03) - READ_HOLDING_REGISTERS
- 4 (0x04) - READ_INPUT_REGISTERS
- 5 (0x05) - WRITE_SINGLE_COIL
- 6 (0x06) - WRITE_SINGLE_REGISTER
- 7 (0x07) - READ_EXCEPTION_STATUS
- 8 (0x08) - DIAGNOSTICS
- 11 (0x0B) - GET_COMM_EVENT_COUNTER
- 12 (0x0C) - GET_COMM_EVENT_LOG
- 15 (0x0F) - WRITE_MULTIPLE_COILS
- 16 (0x10) - WRITE_MULTIPLE_REGISTERS
- 17 (0x11) - REPORT_SERVER_ID
- 22 (0x16) - MASK_WRITE_REGISTER
- 23 (0x17) - WRITE_MULTIPLE_REGISTERS
- 24 (0x18) - READ_FIFO_QUEUE

1.0.2 Using Library

1.0.2.1 Common usage (C++)

Library was written in C++ and it is the main language to use it. To start using this library you must include `ModbusClientPort.h` (`ModbusClient.h`) or `ModbusServerPort.h` header files (of course after add include path to the compiler). This header directly or indirectly include `Modbus.h` main header file. `Modbus.h` header file contains declarations of main data types, functions and class interfaces to work with the library.

It contains definition of `Modbus::StatusCode` enumeration that defines result of library operations, `ModbusInterface` class interface that contains list of functions which the library implements, `Modbus::createClientPort` and `Modbus::createServerPort` functions, that creates corresponding `ModbusClientPort` and `ModbusServerPort` main working classes. Those classes that implements `Modbus` functions for the library for client and server version of protocol, respectively.

1.0.2.2 Client

`ModbusClientPort` implements `Modbus` interface directly and can be used very simple:

```
#include <ModbusClientPort.h>
//...
void main()
{
    Modbus::TcpSettings settings;
    settings.host = "someadr.plc";
    settings.port = Modbus::STANDARD_TCP_PORT;
    settings.timeout = 3000;
    ModbusClientPort *port = Modbus::createClientPort(Modbus::TCP, &settings, true);
    const uint8_t unit = 1;
    const uint16_t offset = 0;
    const uint16_t count = 10;
    uint16_t values[count];
    Modbus::StatusCode status = port->readHoldingRegisters(unit, offset, count, values);
    if (Modbus::StatusIsGood(status))
    {
        // process out array `values` ...
    }
    else
    {
        std::cout << "Error: " << port->lastErrorText() << '\n';
        delete port;
    }
}
//...
```

User don't need to create any connection or open any port, library makes it automatically.

User can use `ModbusClient` class to simplify `Modbus` function's interface (don't need to use `unit` parameter):

```
#include <ModbusClientPort.h>
//...
void main()
{
    //...
    ModbusClient c1(1, port);
    ModbusClient c2(2, port);
    ModbusClient c3(3, port);
    Modbus::StatusCode s1, s2, s3;
    while(1)
    {
        s1 = c1.readHoldingRegisters(0, 10, values);
        s2 = c2.readHoldingRegisters(0, 10, values);
        s3 = c3.readHoldingRegisters(0, 10, values);
        Modbus::msleep(1);
    }
    //...
}
//...
```

In this example 3 clients with unit address 1, 2, 3 are used. User don't need to manage its common resource `port`. Library make it automatically. First `c1` client owns `port`, than when finished resource transferred to `c2` and so on.

1.0.2.3 Server

Unlike client the server do not implement `ModbusInterface` directly. It accepts pointer to `ModbusInterface` in its constructor as parameter and transfer all requests to this interface. So user can define by itself how incoming Modbus-request will be processed:

```
#include <ModbusServerPort.h>
//...
class MyModbusDevice : public ModbusInterface
{
#define MEM_SIZE 16
    uint16_t mem4x[MEM_SIZE];
public:
    MyModbusDevice() { memset(mem4x, 0, sizeof(mem4x)); }
    uint16_t getValue(uint16_t offset) { return mem4x[offset]; }
    void setValue(uint16_t offset, uint16_t value) { mem4x[offset] = value; }
    Modbus::StatusCode readHoldingRegisters(uint8_t unit,
                                             uint16_t offset,
                                             uint16_t count,
                                             uint16_t *values) override
    {
        if (unit != 1)
            return Modbus::Status_BadGatewayPathUnavailable;
        if ((offset + count) <= MEM_SIZE)
        {
            memcpy(values, &mem4x[offset], count*sizeof(uint16_t));
            return Modbus::Status_Good;
        }
        return Modbus::Status_BadIllegalDataAddress;
    }
};

void main()
{
    MyModbusDevice device;
    Modbus::TcpSettings settings;
    settings.port = Modbus::STANDARD_TCP_PORT;
    settings.timeout = 3000;
    ModbusServerPort *port = Modbus::createServerPort(&device, Modbus::TCP, &settings, false);
    int c = 0;
    while (1)
    {
        port->process();
        Modbus::msleep(1);
        if (c % 1000 == 0) setValue(0, getValue(0)+1);
    }
}
//...
```

In this example `MyModbusDevice` `ModbusInterface` class was created. It implements only single function: `readHoldingRegisters` (0x03). All other functions will return `Modbus::Status_BadIllegalFunction` by default.

This example creates `Modbus` TCP server that process connections and increment first 4x register by 1 every second. This example uses non blocking mode.

1.0.2.3.1 Non blocking mode

In non blocking mode `Modbus` function exits immediately even if remote connection processing is not finished. In this case function returns `Modbus::Status_Processing`. This is 'Arduino'-style of programing, when function must not be blocked and return intermediate value that indicates that function is not finished. Then external code call this function again and again until Good or Bad status will not be returned.

Example of non blocking client:

```
#include <ModbusClientPort.h>
//...
void main()
{
    //...
    ModbusClientPort *port = Modbus::createClientPort(Modbus::TCP, &settings, false);
    //...
    while (1)
    {
        s1 = c1.readHoldingRegisters(0, 10, values);
        s2 = c2.readHoldingRegisters(0, 10, values);
    }
}
```

```

        s3 = c3.readHoldingRegisters(0, 10, values);
        doSomeOtherStuffInCurrentThread();
        Modbus::msleep(1);
    }
    //...
}
//...

```

So if user needs to check is function finished he can write:

```

//...
s1 = c1.readHoldingRegisters(0, 10, values);
if (!Modbus::StatusIsProcessing(s1)) {
    // ...
}
//...

```

1.0.2.3.2 Signal/slot mechanism

Library has simplified Qt-like signal/slot mechanism that can use callbacks when some signal is occurred. User can connect function(s) or class method(s) to the predefined signal. Callbacks will be called in the order in which they were connected.

For example `ModbusClientPort` signal/slot mechanism:

```

#include <ModbusClientPort.h>

class Printable
{
public:
    void printTx(const Modbus::Char *source, const uint8_t* buff, uint16_t size)
    {
        std::cout << source << " Tx: " << Modbus::bytesToString(buff, size) << '\n';
    }
};

void printRx(const Modbus::Char *source, const uint8_t* buff, uint16_t size)
{
    std::cout << source << " Rx: " << Modbus::bytesToString(buff, size) << '\n';
}

void main()
{
    //...
    ModbusClientPort *port = Modbus::createClientPort(Modbus::TCP, &settings, false);
    Printable print;
    port->connect(&ModbusClientPort::signalTx, &print, &Printable::printTx);
    port->connect(&ModbusClientPort::signalRx, printRx);
    //...
}

```

1.0.2.4 Using with C

To use the library with pure C language user needs to include only one header: `cModbus.h`. This header includes functions that wraps `Modbus` interface classes and its methods.

```

#include <cModbus.h>
//...
void printTx(const Char *source, const uint8_t* buff, uint16_t size)
{
    Char s[1000];
    printf("%s Tx: %s\n", source, sbytes(buff, size, s, sizeof(s)));
}

void printRx(const Char *source, const uint8_t* buff, uint16_t size)
{
    Char s[1000];
    printf("%s Rx: %s\n", source, sbytes(buff, size, s, sizeof(s)));
}

void main()
{
    TcpSettings settings;
    settings.host = "someadr.plc";
    settings.port = STANDARD_TCP_PORT;
    settings.timeout = 3000;
    const uint8_t unit = 1;
}

```

```

cModbusClient client = cCliCreate(unit, TCP, &settings, true);
cModbusClientPort cpo = cCliGetPort(client);
StatusCode s;
cCpoConnectTx(cpo, printTx);
cCpoConnectRx(cpo, printRx);
while(1)
{
    s = cReadHoldingRegisters(client, 0, 10, values);
    //...
    msleep(1);
}
//...

```

1.0.2.5 Using with Qt

When including `ModbusQt.h` user can use ModbusLib in convenient way in Qt framework. It has wrapper functions for Qt library to use it together with Qt core objects:

```
#include <ModbusQt.h>
```

1.0.3 Examples

Examples is located in `examples` folder or root directory.

1.0.3.1 democlient

`democlient` example demonstrate all implemented functions for client one by one beginning from function with lowest number and then increasing this number with predefined period and other parameters. To see list of available parameters you can print next commands:

```

$ ./democlient -?
$ ./democlient -help

```

1.0.3.2 mbclient

`mbclient` is a simple example that can work like command-line [Modbus](#) Client Tester. It can use only single function at a time but user can change parameters of every supported function. To see list of available parameters you can print next commands:

```

$ ./mbclient -?
$ ./mbclient -help

```

Usage example:

```
$ ./mbclient -func 3 -offset 0 -count 10 -period 500 -n inf
```

1.0.3.3 demoserver

`demoserver` example demonstrate all implemented functions for server. It uses single block for every type of [Modbus](#) memory (0x, 1x, 3x and 4x) and emulates value change for the first 16 bit register by incrementing it by 1 every 1000 milliseconds. So user can run [Modbus](#) Client to check first 16 bit of 000001 (100001) or first register 400001 (300001) changing every 1 second. To see list of available parameters you can print next commands:

```

$ ./demoserver -?
$ ./demoserver -help

```

1.0.3.4 mbserver

`mbserver` is a simple example that can work like command-line [Modbus](#) Server Tester. It implements all function of [Modbus](#) library. So remote client can work with server reading and writing values to it. To see list of available parameters you can print next commands:

```
$ ./mbserver -?
$ ./mbserver -help
```

Usage example:

```
$ ./mbserver -c0 256 -c1 256 -c3 16 -c4 16 -type RTU -serial /dev/ttyS0
```

1.0.4 Tests

Unit Tests using googletest library. Googletest source library must be located in `external/googletest`

1.0.5 Documentations

Documentation is located in `docs` directory. Documentation is automatically generated by doxygen.

1.0.6 Building

1.0.6.1 Build using CMake

1. Build Tools

Previously you need to install c++ compiler kit, git and cmake itself (qt tools if needed).

Then set `PATH` env variable to find compliler, cmake, git etc.

Don't forget to use appropriate version of compiler, linker (x86|x64).

2. Create project directory, move to it and clone repository:

```
$ cd ~
$ mkdir src
$ cd src
$ git clone https://github.com/serhmarch/ModbusLib.git
```

3. Create and/or move to directory for build output, e.g. `~/bin/ModbusLib`:

```
$ cd ~
$ mkdir -p bin/ModbusLib
$ cd bin/ModbusLib
```

4. Run cmake to generate project (make) files.

```
$ cmake -S ~/src/ModbusLib -B .
```

To make Qt-compatibility (switch off by default for cmake build) you can use next command (e.g. for Windows 64):

```
>cmake -DDB_QT_ENABLED=ON -DCMAKE_PREFIX_PATH:PATH=C:/Qt/5.15.2/msvc2019_64 -S <path\to\src\ModbusLib> -B .
```

5. Make binaries (+ debug|release config):

```
$ cmake --build .
$ cmake --build . --config Debug
$ cmake --build . --config Release
```

6. Resulting bin files is located in `./bin` directory.

1.0.6.2 Build using qmake

1. Update package list:

```
$ sudo apt-get update
```

2. Install main build tools like g++, make etc:

```
$ sudo apt-get install build-essential
```

3. Install Qt tools:

```
$ sudo apt-get install qtbase5-dev qttools5-dev
```

4. Check for correct instalation:

```
$ whereis qmake
qmake: /usr/bin/qmake
$ whereis libQt5Core*
libQt5Core.prl: /usr/lib/x86_64-linux-gnu/libQt5Core.prl
libQt5Core.so: /usr/lib/x86_64-linux-gnu/libQt5Core.so
libQt5Core.so.5: /usr/lib/x86_64-linux-gnu/libQt5Core.so.5
libQt5Core.so.5.15: /usr/lib/x86_64-linux-gnu/libQt5Core.so.5.15
libQt5Core.so.5.15.3: /usr/lib/x86_64-linux-gnu/libQt5Core.so.5.15.3
$ whereis libQt5Help*
libQt5Help.prl: /usr/lib/x86_64-linux-gnu/libQt5Help.prl
libQt5Help.so: /usr/lib/x86_64-linux-gnu/libQt5Help.so
libQt5Help.so.5: /usr/lib/x86_64-linux-gnu/libQt5Help.so.5
libQt5Help.so.5.15: /usr/lib/x86_64-linux-gnu/libQt5Help.so.5.15
libQt5Help.so.5.15.3: /usr/lib/x86_64-linux-gnu/libQt5Help.so.5.15.3
```

5. Install git:

```
$ sudo apt-get install git
```

6. Create project directory, move to it and clone repository:

```
$ cd ~
$ mkdir src
$ cd src
$ git clone https://github.com/serhmarch/ModbusLib.git
```

7. Create and/or move to directory for build output, e.g. ~/bin/ModbusLib:

```
$ cd ~
$ mkdir -p bin/ModbusLib
$ cd bin/ModbusLib
```

8. Run qmake to create Makefile for build:

```
$ qmake ~/src/ModbusLib/src/ModbusLib.pro -spec linux-g++
```

9. To ensure Makefile was created print:

```
$ ls -l
total 36
-rw-r--r-- 1 march march 35001 May  6 18:41 Makefile
```

10. Finally to make current set of programs print:

```
$ make
```

11. After build step move to <build_folder>/bin to ensure everything is correct:

```
$ cd bin
$ pwd
~/bin/ModbusLib/bin
```

Chapter 2

Namespace Index

2.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

Modbus

Main [Modbus](#) namespace. Contains classes, functions and constants to work with Modbus-protocol [17](#)

Chapter 3

Hierarchical Index

3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Modbus::Address	51
Modbus::Defaults	54
ModbusSerialPort::Defaults	56
ModbusTcpPort::Defaults	57
ModbusTcpServer::Defaults	58
ModbusInterface	89
ModbusClientPort	69
ModbusObject	97
ModbusClient	62
ModbusClientPort	69
ModbusServerPort	115
ModbusServerResource	120
ModbusTcpServer	134
ModbusPort	101
ModbusSerialPort	109
ModbusAscPort	59
ModbusRtuPort	106
ModbusTcpPort	128
ModbusSlotBase< ReturnType, Args >	124
ModbusSlotBase< ReturnType, Args ... >	124
ModbusSlotFunction< ReturnType, Args >	125
ModbusSlotMethod< T, ReturnType, Args >	127
Modbus::SerialSettings	140
Modbus::Strings	141
Modbus::TcpSettings	143

Chapter 4

Class Index

4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Modbus::Address	
Modbus Data Address class. Represents Modbus Data Address	51
Modbus::Defaults	
Holds the default values of the settings	54
ModbusSerialPort::Defaults	
Holds the default values of the settings	56
ModbusTcpPort::Defaults	
Defaults class contain default settings values for ModbusTcpPort	57
ModbusTcpServer::Defaults	
Defaults class contain default settings values for ModbusTcpServer	58
ModbusAscPort	
Implements ASCII version of the Modbus communication protocol	59
ModbusClient	
The ModbusClient class implements the interface of the client part of the Modbus protocol	62
ModbusClientPort	
The ModbusClientPort class implements the algorithm of the client part of the Modbus communication protocol port	69
ModbusInterface	
Main interface of Modbus communication protocol	89
ModbusObject	
The ModbusObject class is the base class for objects that use signal/slot mechanism	97
ModbusPort	
The abstract class ModbusPort is the base class for a specific implementation of the Modbus communication protocol	101
ModbusRtuPort	
Implements RTU version of the Modbus communication protocol	106
ModbusSerialPort	
The abstract class ModbusSerialPort is the base class serial port Modbus communications	109
ModbusServerPort	
Abstract base class for direct control of ModbusPort derived classes (TCP or serial) for server side	115
ModbusServerResource	
Implements direct control for ModbusPort derived classes (TCP or serial) for server side	120
ModbusSlotBase< ReturnType, Args >	
ModbusSlotBase base template for slot (method or function)	124

ModbusSlotFunction< ReturnType, Args >	
ModbusSlotFunction template class hold pointer to slot function	125
ModbusSlotMethod< T, ReturnType, Args >	
ModbusSlotMethod template class hold pointer to object and its method	127
ModbusTcpPort	
Class ModbusTcpPort implements TCP version of Modbus protocol	128
ModbusTcpServer	
The ModbusTcpServer class implements TCP server part of the Modbus protocol	134
Modbus::SerialSettings	
Struct to define settings for Serial Port	140
Modbus::Strings	
Sets constant key values for the map of settings	141
Modbus::TcpSettings	
Struct to define settings for TCP connection	143

Chapter 5

File Index

5.1 File List

Here is a list of all documented files with brief descriptions:

C:/Users/march/Dropbox/PRJ/ModbusLib/src/cModbus.h	
Contains library interface for C language	145
C:/Users/march/Dropbox/PRJ/ModbusLib/src/Modbus.h	
Contains general definitions of the Modbus protocol	176
C:/Users/march/Dropbox/PRJ/ModbusLib/src/Modbus_config.h	
Contains definition of ASCII serial port class	184
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusAscPort.h	
Header file of Modbus client	185
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusClientPort.h	
General file of the algorithm of the client part of the Modbus protocol port	187
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusGlobal.h	
Contains general definitions of the Modbus library (for C++ and "pure" C)	191
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusObject.h	
The header file defines the class templates used to create signal/slot-like mechanism	203
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusPlatform.h	
Definition of platform specific macros	206
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusPort.h	
Header file of abstract class ModbusPort	207
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusQt.h	
Qt support file for ModbusLib	209
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusRtuPort.h	
Contains definition of RTU serial port class	214
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusSerialPort.h	
Contains definition of base serial port class	215
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusServerPort.h	
The header file defines the class that controls specific port	217
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusServerResource.h	
Header file of class ModbusTcpPort	219
C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusTcpServer.h	
Header file of Modbus TCP server	220

Chapter 6

Namespace Documentation

6.1 Modbus Namespace Reference

Main [Modbus](#) namespace. Contains classes, functions and constants to work with Modbus-protocol.

Classes

- class [Address](#)
[Modbus](#) Data [Address](#) class. Represents [Modbus](#) Data [Address](#).
- class [Defaults](#)
Holds the default values of the settings.
- struct [SerialSettings](#)
Struct to define settings for Serial Port.
- class [Strings](#)
Sets constant key values for the map of settings.
- struct [TcpSettings](#)
Struct to define settings for TCP connection.

Typedefs

- typedef std::string **String**
[Modbus::String](#) class for strings.
- template<class T >
using **List** = std::list<T>
[Modbus::List](#) template class.
- typedef void * **Handle**
Handle type for native OS values.
- typedef char **Char**
Type for [Modbus](#) character.
- typedef uint32_t **Timer**
Type for [Modbus](#) timer.
- typedef int64_t **Timestamp**
Type for [Modbus](#) timestamp (in UNIX millisec format)
- typedef enum [Modbus::_MemoryType](#) **MemoryType**
Defines type of memory used in [Modbus](#) protocol.
- typedef enum [Modbus::_Color](#) **Color**
Enum of color (used for console text color).
- typedef QHash< QString, QVariant > **Settings**
Map for settings of [Modbus](#) protocol where key has type [QString](#) and value is [QVariant](#).

Enumerations

- enum `Constants` { `VALID_MODBUS_ADDRESS_BEGIN` = 1 , `VALID_MODBUS_ADDRESS_END` = 247 , `STANDARD_TCP_PORT` = 502 }
Define list of constants of Modbus protocol.
- enum `_MemoryType` {
`Memory_Unknown` = 0xFFFF , `Memory_0x` = 0 , `Memory_Coils` = `Memory_0x` , `Memory_1x` = 1 ,
`Memory_DiscreteInputs` = `Memory_1x` , `Memory_3x` = 3 , `Memory_InputRegisters` = `Memory_3x` ,
`Memory_4x` = 4 ,
`Memory_HoldingRegisters` = `Memory_4x` }
Defines type of memory used in Modbus protocol.
- enum `_Color` {
`Color_Black` , `Color_Red` , `Color_Green` , `Color_Yellow` ,
`Color_Blue` , `Color_Magenta` , `Color_Cyan` , `Color_White` ,
`Color_Default` }
Enum of color (used for console text color).
- enum `StatusCode` {
`Status_Processing` = 0x80000000 , `Status_Good` = 0x00000000 , `Status_Bad` = 0x01000000 ,
`Status_Uncertain` = 0x02000000 ,
`Status_BadIllegalFunction` = `Status_Bad` | 0x01 , `Status_BadIllegalDataAddress` = `Status_Bad` | 0x02 ,
`Status_BadIllegalDataValue` = `Status_Bad` | 0x03 , `Status_BadServerDeviceFailure` = `Status_Bad` | 0x04 ,
`Status_BadAcknowledge` = `Status_Bad` | 0x05 , `Status_BadServerDeviceBusy` = `Status_Bad` | 0x06 ,
`Status_BadNegativeAcknowledge` = `Status_Bad` | 0x07 , `Status_BadMemoryParityError` = `Status_Bad` | 0x08
, `Status_BadGatewayPathUnavailable` = `Status_Bad` | 0x0A , `Status_BadGatewayTargetDeviceFailedToRespond`
= `Status_Bad` | 0x0B , `Status_BadEmptyResponse` = `Status_Bad` | 0x101 , `Status_BadNotCorrectRequest` ,
`Status_BadNotCorrectResponse` , `Status_BadWriteBufferOverflow` , `Status_BadReadBufferOverflow` ,
`Status_BadSerialOpen` = `Status_Bad` | 0x201 ,
`Status_BadSerialWrite` , `Status_BadSerialRead` , `Status_BadSerialReadTimeout` , `Status_BadSerialWriteTimeout`
, `Status_BadAscMissColon` = `Status_Bad` | 0x301 , `Status_BadAscMissCrLf` , `Status_BadAscChar` ,
`Status_BadLrc` ,
`Status_BadCrc` = `Status_Bad` | 0x401 , `Status_BadTcpCreate` = `Status_Bad` | 0x501 , `Status_BadTcpConnect`
, `Status_BadTcpWrite` ,
`Status_BadTcpRead` , `Status_BadTcpBind` , `Status_BadTcpListen` , `Status_BadTcpAccept` ,
`Status_BadTcpDisconnect` }
Defines status of executed Modbus functions.
- enum `ProtocolType` { `ASC` , `RTU` , `TCP` }
Defines type of Modbus protocol.
- enum `Parity` {
`NoParity` , `EvenParity` , `OddParity` , `SpaceParity` ,
`MarkParity` }
Defines Parity for serial port.
- enum `StopBits` { `OneStop` , `OneAndHalfStop` , `TwoStop` }
Defines Stop Bits for serial port.
- enum `FlowControl` { `NoFlowControl` , `HardwareControl` , `SoftwareControl` }
FlowControl Parity for serial port.

Functions

- `MODBUS_EXPORT String` `getLastErrorText` ()
- `MODBUS_EXPORT String` `trim` (const `String` &str)
- `template<class StringT , class T >`
`StringT` `toBinString` (T value)

- `template<class StringT, class T >`
`StringT toOctString (T value)`
- `template<class StringT, class T >`
`StringT toHexString (T value)`
- `template<class StringT, class T >`
`StringT toDecString (T value)`
- `template<class StringT, class T >`
`StringT toDecString (T value, int c, char fillChar='0')`
- `template<typename StringT >`
`bool startsWith (const StringT &s, const char *prefix)`
- `int decDigitValue (int ch)`
- `int hexDigitValue (int ch)`
- `String toModbusString (int val)`
- `MODBUS_EXPORT String bytesToString (const uint8_t *buff, uint32_t count)`
- `MODBUS_EXPORT String asciiToString (const uint8_t *buff, uint32_t count)`
- `MODBUS_EXPORT List< String > availableSerialPorts ()`
- `MODBUS_EXPORT List< int32_t > availableBaudRate ()`
- `MODBUS_EXPORT List< int8_t > availableDataBits ()`
- `MODBUS_EXPORT List< Parity > availableParity ()`
- `MODBUS_EXPORT List< StopBits > availableStopBits ()`
- `MODBUS_EXPORT List< FlowControl > availableFlowControl ()`
- `MODBUS_EXPORT ModbusPort * createPort (ProtocolType type, const void *settings, bool blocking)`
- `MODBUS_EXPORT ModbusClientPort * createClientPort (ProtocolType type, const void *settings, bool blocking)`
- `MODBUS_EXPORT ModbusServerPort * createServerPort (ModbusInterface *device, ProtocolType type, const void *settings, bool blocking)`
- `StatusCodes readMemRegs (uint32_t offset, uint32_t count, void *values, const void *memBuff, uint32_t memRegCount)`
- `StatusCodes writeMemRegs (uint32_t offset, uint32_t count, const void *values, void *memBuff, uint32_t memRegCount)`
- `StatusCodes readMemBits (uint32_t offset, uint32_t count, void *values, const void *memBuff, uint32_t memBitCount)`
- `StatusCodes writeMemBits (uint32_t offset, uint32_t count, const void *values, void *memBuff, uint32_t memBitCount)`
- `bool StatusIsProcessing (StatusCodes status)`
- `bool StatusIsGood (StatusCodes status)`
- `bool StatusIsBad (StatusCodes status)`
- `bool StatusIsUncertain (StatusCodes status)`
- `bool StatusIsStandardError (StatusCodes status)`
- `bool getBit (const void *bitBuff, uint16_t bitNum)`
- `bool getBitS (const void *bitBuff, uint16_t bitNum, uint16_t maxBitCount)`
- `void setBit (void *bitBuff, uint16_t bitNum, bool value)`
- `void setBitS (void *bitBuff, uint16_t bitNum, bool value, uint16_t maxBitCount)`
- `bool * getBits (const void *bitBuff, uint16_t bitNum, uint16_t bitCount, bool *boolBuff)`
- `bool * getBitsS (const void *bitBuff, uint16_t bitNum, uint16_t bitCount, bool *boolBuff, uint16_t maxBitCount)`
- `void * setBits (void *bitBuff, uint16_t bitNum, uint16_t bitCount, const bool *boolBuff)`
- `void * setBitsS (void *bitBuff, uint16_t bitNum, uint16_t bitCount, const bool *boolBuff, uint16_t maxBitCount)`
- `MODBUS_EXPORT uint32_t modbusLibVersion ()`
- `MODBUS_EXPORT const Char * modbusLibVersionStr ()`
- `uint16_t toModbusOffset (uint32_t adr)`
- `MODBUS_EXPORT uint16_t crc16 (const uint8_t *byteArr, uint32_t count)`
- `MODBUS_EXPORT uint8_t lrc (const uint8_t *byteArr, uint32_t count)`
- `MODBUS_EXPORT StatusCodes readMemRegs (uint32_t offset, uint32_t count, void *values, const void *memBuff, uint32_t memRegCount, uint32_t *outCount)`
- `MODBUS_EXPORT StatusCodes writeMemRegs (uint32_t offset, uint32_t count, const void *values, void *memBuff, uint32_t memRegCount, uint32_t *outCount)`

- [MODBUS_EXPORT StatusCode readMemBits](#) (uint32_t offset, uint32_t count, void *values, const void *memBuff, uint32_t memBitCount, uint32_t *outCount)
- [MODBUS_EXPORT StatusCode writeMemBits](#) (uint32_t offset, uint32_t count, const void *values, void *memBuff, uint32_t memBitCount, uint32_t *outCount)
- [MODBUS_EXPORT uint32_t bytesToAscii](#) (const uint8_t *bytesBuff, uint8_t *asciiBuff, uint32_t count)
- [MODBUS_EXPORT uint32_t asciiToBytes](#) (const uint8_t *asciiBuff, uint8_t *bytesBuff, uint32_t count)
- [MODBUS_EXPORT Char * sbytes](#) (const uint8_t *buff, uint32_t count, [Char](#) *str, uint32_t strmaxlen)
- [MODBUS_EXPORT Char * sascii](#) (const uint8_t *buff, uint32_t count, [Char](#) *str, uint32_t strmaxlen)
- [MODBUS_EXPORT const Char * sprotocolType](#) ([ProtocolType](#) type)
- [MODBUS_EXPORT ProtocolType toprotocolType](#) (const [Char](#) *s)
- [MODBUS_EXPORT const Char * sbaudRate](#) (int32_t baudRate)
- [MODBUS_EXPORT int32_t tobaudRate](#) (const [Char](#) *s)
- [MODBUS_EXPORT const Char * sdataBits](#) (int8_t dataBits)
- [MODBUS_EXPORT int8_t todataBits](#) (const [Char](#) *s)
- [MODBUS_EXPORT const Char * sparity](#) ([Parity](#) parity)
- [MODBUS_EXPORT Parity toparity](#) (const [Char](#) *s)
- [MODBUS_EXPORT const Char * sstopBits](#) ([StopBits](#) stopBits)
- [MODBUS_EXPORT StopBits tostopBits](#) (const [Char](#) *s)
- [MODBUS_EXPORT const Char * sflowControl](#) ([FlowControl](#) flowControl)
- [MODBUS_EXPORT FlowControl toflowControl](#) (const [Char](#) *s)
- [MODBUS_EXPORT Timer timer](#) ()
- [MODBUS_EXPORT Timestamp currentTimestamp](#) ()
- [MODBUS_EXPORT void setConsoleColor](#) ([Color](#) color)
- [MODBUS_EXPORT void msleep](#) (uint32_t msec)
- [MODBUS_EXPORT uint8_t getSettingUnit](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT ProtocolType getSettingType](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT uint32_t getSettingTries](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT QString getSettingHost](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT uint16_t getSettingPort](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT uint32_t getSettingTimeout](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT uint32_t getSettingMaxconn](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT QString getSettingSerialPortName](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT int32_t getSettingBaudRate](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT int8_t getSettingDataBits](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT Parity getSettingParity](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT StopBits getSettingStopBits](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT FlowControl getSettingFlowControl](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT uint32_t getSettingTimeoutFirstByte](#) (const [Settings](#) &s, bool *ok=nullptr)

6.1.1 Detailed Description

Main [Modbus](#) namespace. Contains classes, functions and constants to work with Modbus-protocol.

6.1.2 Enumeration Type Documentation

6.1.2.1 [_MemoryType](#)

```
enum Modbus::\_MemoryType
```

Defines type of memory used in [Modbus](#) protocol.

Enumerator

Memory_Unknown	Invalid memory type.
Memory_0x	Memory allocated for coils/discrete outputs.
Memory_Coils	Same as <code>Memory_0x</code> .
Memory_1x	Memory allocated for discrete inputs.
Memory_DiscreteInputs	Same as <code>Memory_1x</code> .
Memory_3x	Memory allocated for analog inputs.
Memory_InputRegisters	Same as <code>Memory_3x</code> .
Memory_4x	Memory allocated for holding registers/analog outputs.
Memory_HoldingRegisters	Same as <code>Memory_4x</code> .

6.1.2.2 Constants

```
enum Modbus::Constants
```

Define list of constants of [Modbus](#) protocol.

Enumerator

VALID_MODBUS_ADDRESS_BEGIN	Start of Modbus device address range according to specification.
VALID_MODBUS_ADDRESS_END	End of the Modbus protocol device address range according to the specification.
STANDARD_TCP_PORT	Standard TCP port of the Modbus protocol.

6.1.2.3 FlowControl

```
enum Modbus::FlowControl
```

FlowControl Parity for serial port.

Enumerator

NoFlowControl	No flow control.
HardwareControl	Hardware flow control (RTS/CTS).
SoftwareControl	Software flow control (XON/XOFF).

6.1.2.4 Parity

```
enum Modbus::Parity
```

Defines Parity for serial port.

Enumerator

NoParity	No parity bit is sent. This is the most common parity setting.
EvenParity	The number of 1 bits in each character, including the parity bit, is always even.

OddParity	The number of 1 bits in each character, including the parity bit, is always odd. It ensures that at least one state transition occurs in each character.
SpaceParity	Space parity. The parity bit is sent in the space signal condition. It does not provide error detection information.
MarkParity	Mark parity. The parity bit is always set to the mark signal condition (logical 1). It does not provide error detection information.

6.1.2.5 ProtocolType

```
enum Modbus::ProtocolType
```

Defines type of [Modbus](#) protocol.

Enumerator

ASC	ASCII version of Modbus communication protocol.
RTU	RTU version of Modbus communication protocol.
TCP	TCP version of Modbus communication protocol.

6.1.2.6 StatusCode

```
enum Modbus::StatusCode
```

Defines status of executed [Modbus](#) functions.

Enumerator

Status_Processing	The operation is not complete. Further operation is required.
Status_Good	Successful result.
Status_Bad	Error. General.
Status_Uncertain	The status is undefined.
Status_BadIllegalFunction	Standard error. The feature is not supported.
Status_BadIllegalDataAddress	Standard error. Invalid data address.
Status_BadIllegalDataValue	Standard error. Invalid data value.
Status_BadServerDeviceFailure	Standard error. Failure during a specified operation.
Status_BadAcknowledge	Standard error. The server has accepted the request and is processing it, but it will take a long time.
Status_BadServerDeviceBusy	Standard error. The server is busy processing a long command. The request must be repeated later.
Status_BadNegativeAcknowledge	Standard error. The programming function cannot be performed.
Status_BadMemoryParityError	Standard error. The server attempted to read a record file but detected a parity error in memory.
Status_BadGatewayPathUnavailable	Standard error. Indicates that the gateway was unable to allocate an internal communication path from the input port o the output port for processing the request. Usually means that the gateway is misconfigured or overloaded.

Enumerator

Status_BadGatewayTargetDeviceFailedToRespond	Standard error. Indicates that no response was obtained from the target device. Usually means that the device is not present on the network.
Status_BadEmptyResponse	Error. Empty request/response body.
Status_BadNotCorrectRequest	Error. Invalid request.
Status_BadNotCorrectResponse	Error. Invalid response.
Status_BadWriteBufferOverflow	Error. Write buffer overflow.
Status_BadReadBufferOverflow	Error. Request receive buffer overflow.
Status_BadSerialOpen	Error. Serial port cannot be opened.
Status_BadSerialWrite	Error. Cannot send a parcel to the serial port.
Status_BadSerialRead	Error. Reading the serial port (timeout)
Status_BadSerialReadTimeout	Error. Reading the serial port (timeout)
Status_BadSerialWriteTimeout	Error. Writing the serial port (timeout)
Status_BadAscMissColon	Error (ASC). Missing packet start character ':'.
Status_BadAscMissCrLf	Error (ASC). '\r\n' end of packet character missing.
Status_BadAscChar	Error (ASC). Invalid ASCII character.
Status_BadLrc	Error (ASC). Invalid checksum.
Status_BadCrc	Error (RTU). Wrong checksum.
Status_BadTcpCreate	Error. Unable to create a TCP socket.
Status_BadTcpConnect	Error. Unable to create a TCP connection.
Status_BadTcpWrite	Error. Unable to send a TCP packet.
Status_BadTcpRead	Error. Unable to receive a TCP packet.
Status_BadTcpBind	Error. Unable to bind a TCP socket (server side)
Status_BadTcpListen	Error. Unable to listen a TCP socket (server side)
Status_BadTcpAccept	Error. Unable accept bind a TCP socket (server side)
Status_BadTcpDisconnect	Error. Bad disconnection result.

6.1.2.7 StopBits

```
enum Modbus::StopBits
```

Defines Stop Bits for serial port.

Enumerator

OneStop	1 stop bit.
OneAndHalfStop	1.5 stop bit.
TwoStop	2 stop bits.

6.1.3 Function Documentation

6.1.3.1 addressFromQString()

```
Address Modbus::addressFromQString (
    const QString & s) [inline]
```

Convert String repr to [Modbus::Address](#)

6.1.3.2 `asciiToBytes()`

```
MODBUS_EXPORT uint32_t Modbus::asciiToBytes (
    const uint8_t * asciiBuff,
    uint8_t * bytesBuff,
    uint32_t count)
```

Function converts ASCII repr *asciiBuff* to binary byte array. Every byte of output *bytesBuff* are repr as two bytes in *asciiBuff*, where most signified tetrabits represented as leading byte in hex digit in ASCII encoding (upper) and less signified tetrabits represented as tailing byte in hex digit in ASCII encoding (upper). *count* is a size of input array *asciiBuff*.

Note

Output array *bytesBuff* must be at least twice smaller than input array *asciiBuff*.

Returns

Returns size of *bytesBuff* in bytes which calc as $\{output = count / 2\}$

6.1.3.3 `asciiToString()` [1/2]

```
QString Modbus::asciiToString (
    const QByteArray & v) [inline]
```

Make string representation of ASCII array and separate bytes by space

6.1.3.4 `asciiToString()` [2/2]

```
MODBUS_EXPORT String Modbus::asciiToString (
    const uint8_t * buff,
    uint32_t count)
```

Make string representation of ASCII array and separate bytes by space

6.1.3.5 `availableBaudRate()`

```
MODBUS_EXPORT List< int32_t > Modbus::availableBaudRate ()
```

Return list of baud rates

6.1.3.6 `availableDataBits()`

```
MODBUS_EXPORT List< int8_t > Modbus::availableDataBits ()
```

Return list of data bits

6.1.3.7 availableFlowControl()

```
MODBUS_EXPORT List< FlowControl > Modbus::availableFlowControl ()
```

Return list of FlowControl values

6.1.3.8 availableParity()

```
MODBUS_EXPORT List< Parity > Modbus::availableParity ()
```

Return list of Parity values

6.1.3.9 availableSerialPortList()

```
MODBUS_EXPORT QStringList Modbus::availableSerialPortList ()
```

Returns list of string that represent names of serial ports

6.1.3.10 availableSerialPorts()

```
MODBUS_EXPORT List< String > Modbus::availableSerialPorts ()
```

Return list of names of available serial ports

6.1.3.11 availableStopBits()

```
MODBUS_EXPORT List< StopBits > Modbus::availableStopBits ()
```

Return list of StopBits values

6.1.3.12 bytesToAscii()

```
MODBUS_EXPORT uint32_t Modbus::bytesToAscii (
    const uint8_t * bytesBuff,
    uint8_t * asciiBuff,
    uint32_t count)
```

Function converts byte array `bytesBuff` to ASCII repr of byte array. Every byte of `bytesBuff` are repr as two bytes in `asciiBuff`, where most signified tetrabits represented as leading byte in hex digit in ASCII encoding (upper) and less signified tetrabits represented as tailing byte in hex digit in ASCII encoding (upper). `count` is count bytes of `bytesBuff`.

Note

Output array `asciiBuff` must be at least twice bigger than input array `bytesBuff`.

Returns

Returns size of `asciiBuff` in bytes which calc as `{output = count * 2}`

6.1.3.13 bytesToString() [1/2]

```
QString Modbus::bytesToString (
    const QByteArray & v) [inline]
```

Make string representation of bytes array and separate bytes by space

6.1.3.14 bytesToString() [2/2]

```
MODBUS_EXPORT String Modbus::bytesToString (
    const uint8_t * buff,
    uint32_t count)
```

Make string representation of bytes array and separate bytes by space

6.1.3.15 crc16()

```
MODBUS_EXPORT uint16_t Modbus::crc16 (
    const uint8_t * byteArr,
    uint32_t count)
```

CRC16 checksum hash function (for [Modbus RTU](#)).

Returns

Returns a 16-bit unsigned integer value of the checksum

6.1.3.16 createClientPort() [1/2]

```
MODBUS_EXPORT ModbusClientPort * Modbus::createClientPort (
    const Settings & settings,
    bool blocking = false)
```

Same as [Modbus::createClientPort\(ProtocolType type, const void *settings, bool blocking\)](#) but [ProtocolType type](#) and [const void *settings](#) are defined by [Modbus::Settings](#) key-value map.

6.1.3.17 createClientPort() [2/2]

```
MODBUS_EXPORT ModbusClientPort * Modbus::createClientPort (
    ProtocolType type,
    const void * settings,
    bool blocking)
```

Function for creation [ModbusClientPort](#) with defined parameters:

Parameters

in	<i>type</i>	Protocol type: TCP, RTU, ASC.
in	<i>settings</i>	For TCP must be pointer: TcpSettings* , SerialSettings* otherwise.
in	<i>blocking</i>	If true blocking will be set, non blocking otherwise.

6.1.3.18 createPort() [1/2]

```
MODBUS_EXPORT ModbusPort * Modbus::createPort (
    const Settings & settings,
    bool blocking = false)
```

Same as `Modbus::createPort(ProtocolType type, const void *settings, bool blocking)` but `ProtocolType type` and `const void *settings` are defined by `Modbus::Settings` key-value map.

6.1.3.19 createPort() [2/2]

```
MODBUS_EXPORT ModbusPort * Modbus::createPort (
    ProtocolType type,
    const void * settings,
    bool blocking)
```

Function for creation `ModbusPort` with defined parameters:

Parameters

in	<i>type</i>	Protocol type: TCP, RTU, ASC.
in	<i>settings</i>	For TCP must be pointer: <code>TcpSettings*</code> , <code>SerialSettings*</code> otherwise.
in	<i>blocking</i>	If true blocking will be set, non blocking otherwise.

6.1.3.20 createServerPort() [1/2]

```
MODBUS_EXPORT ModbusServerPort * Modbus::createServerPort (
    ModbusInterface * device,
    const Settings & settings,
    bool blocking = false)
```

Same as `Modbus::createServerPort(ProtocolType type, const void *settings, bool blocking)` but `ProtocolType type` and `const void *settings` are defined by `Modbus::Settings` key-value map.

6.1.3.21 createServerPort() [2/2]

```
MODBUS_EXPORT ModbusServerPort * Modbus::createServerPort (
    ModbusInterface * device,
    ProtocolType type,
    const void * settings,
    bool blocking)
```

Function for creation `ModbusServerPort` with defined parameters:

Parameters

in	<i>device</i>	Pointer to the <code>ModbusInterface</code> implementation to which all requests for <code>Modbus</code> functions are forwarded.
in	<i>type</i>	Protocol type: TCP, RTU, ASC.
in	<i>settings</i>	For TCP must be pointer: <code>TcpSettings*</code> , <code>SerialSettings*</code> otherwise.
in	<i>blocking</i>	If true blocking will be set, non blocking otherwise.

6.1.3.22 currentTimestamp()

```
MODBUS_EXPORT Timestamp Modbus::currentTimestamp ()
```

Get current timestamp in UNIX format in milliseconds.

6.1.3.23 decDigitValue()

```
int Modbus::decDigitValue (
    int ch) [inline]
```

Returns value of decimal digit [0-9] for ASCII code *ch* or -1 if the value cannot be converted.

6.1.3.24 enumKey() [1/2]

```
template<class EnumType >
QString Modbus::enumKey (
    EnumType value,
    const QString & byDef = QString()) [inline]
```

Convert value to QString key for type

6.1.3.25 enumKey() [2/2]

```
template<class EnumType >
QString Modbus::enumKey (
    int value) [inline]
```

Convert value to QString key for type

6.1.3.26 enumValue() [1/4]

```
template<class EnumType >
EnumType Modbus::enumValue (
    const QString & key,
    bool * ok = nullptr,
    EnumType defaultValue = static_cast<EnumType>(-1)) [inline]
```

Convert key to value for enumeration by QString key

6.1.3.27 enumValue() [2/4]

```
template<class EnumType >
EnumType Modbus::enumValue (
    const QVariant & value) [inline]
```

Convert QVariant value to enumeration value (int - value, string - key).

6.1.3.28 enumValue() [3/4]

```
template<class EnumType >
EnumType Modbus::enumValue (
    const QVariant & value,
    bool * ok = nullptr,
    EnumType defaultValue = static_cast<EnumType>(-1)) [inline]
```

Convert `QVariant` `value` to enumeration value (int - value, string - key). Stores result of conversion in output parameter `ok`. If value can't be converted, `defaultValue` is returned.

6.1.3.29 enumValue() [4/4]

```
template<class EnumType >
EnumType Modbus::enumValue (
    const QVariant & value,
    EnumType defaultValue) [inline]
```

Convert `QVariant` `value` to enumeration value (int - value, string - key). If value can't be converted, `defaultValue` is returned.

6.1.3.30 getBit()

```
bool Modbus::getBit (
    const void * bitBuff,
    uint16_t bitNum) [inline]
```

Returns the value of the bit with number 'bitNum' from the bit array 'bitBuff'.

6.1.3.31 getBitS()

```
bool Modbus::getBitS (
    const void * bitBuff,
    uint16_t bitNum,
    uint16_t maxBitCount) [inline]
```

Returns the value of the bit with the number 'bitNum' from the bit array 'bitBuff', if the bit number is greater than or equal to 'maxBitCount', then 'false' is returned.

6.1.3.32 getBits()

```
bool * Modbus::getBits (
    const void * bitBuff,
    uint16_t bitNum,
    uint16_t bitCount,
    bool * boolBuff) [inline]
```

Gets the values of bits with number `bitNum` and count `bitCount` from the bit array `bitBuff` and stores their values in the boolean array `boolBuff`, where the value of each bit is stored as a separate `bool` value.

Returns

A pointer to the `boolBuff` array.

6.1.3.33 getBitsS()

```
bool * Modbus::getBitsS (
    const void * bitBuff,
    uint16_t bitNum,
    uint16_t bitCount,
    bool * boolBuff,
    uint16_t maxBitCount) [inline]
```

Similar to the `Modbus::getBits(const void*,uint16_t,uint16_t,bool*)` function, but it is controlled that the size does not exceed the maximum number of bits `maxBitCount`.

Returns

A pointer to the `boolBuff` array.

6.1.3.34 getLastErrorText()

```
MODBUS_EXPORT String Modbus::getLastErrorText ()
```

Returns string representation of the last error

6.1.3.35 getSettingBaudRate()

```
MODBUS_EXPORT int32_t Modbus::getSettingBaudRate (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the serial port's baud rate. If value can't be retrieved that default value is returned and `*ok = false` (if provided).

6.1.3.36 getSettingBroadcastEnabled()

```
MODBUS_EXPORT bool Modbus::getSettingBroadcastEnabled (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the serial port enables broadcast mode for 0 unit address. If value can't be retrieved that default value is returned and `*ok = false` (if provided).

6.1.3.37 getSettingDataBits()

```
MODBUS_EXPORT int8_t Modbus::getSettingDataBits (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the serial port's data bits. If value can't be retrieved that default value is returned and `*ok = false` (if provided).

6.1.3.38 getSettingFlowControl()

```
MODBUS_EXPORT FlowControl Modbus::getSettingFlowControl (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the serial port's flow control. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.39 getSettingHost()

```
MODBUS_EXPORT QString Modbus::getSettingHost (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the IP address or DNS name of the remote device. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.40 getSettingMaxconn()

```
MODBUS_EXPORT uint32_t Modbus::getSettingMaxconn (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the maximum number of simultaneous connections to the server. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.41 getSettingParity()

```
MODBUS_EXPORT Parity Modbus::getSettingParity (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the serial port's parity. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.42 getSettingPort()

```
MODBUS_EXPORT uint16_t Modbus::getSettingPort (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the TCP port of the remote device. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.43 getSettingSerialPortName()

```
MODBUS_EXPORT QString Modbus::getSettingSerialPortName (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the serial port name. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.44 getSettingStopBits()

```
MODBUS_EXPORT StopBits Modbus::getSettingStopBits (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the serial port's stop bits. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.45 getSettingTimeout()

```
MODBUS_EXPORT uint32_t Modbus::getSettingTimeout (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for connection timeout (milliseconds). If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.46 getSettingTimeoutFirstByte()

```
MODBUS_EXPORT uint32_t Modbus::getSettingTimeoutFirstByte (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the serial port's timeout waiting first byte of packet. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.47 getSettingTimeoutInterByte()

```
MODBUS_EXPORT uint32_t Modbus::getSettingTimeoutInterByte (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the serial port's timeout waiting next byte of packet. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.48 getSettingTries()

```
MODBUS_EXPORT uint32_t Modbus::getSettingTries (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for number of tries a [Modbus](#) request is repeated if it fails. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.49 getSettingType()

```
MODBUS_EXPORT ProtocolType Modbus::getSettingType (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the type of [Modbus](#) protocol. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.50 getSettingUnit()

```
MODBUS_EXPORT uint8_t Modbus::getSettingUnit (
    const Settings & s,
    bool * ok = nullptr)
```

Get settings value for the unit number of remote device. If value can't be retrieved that default value is returned and *ok = false (if provided).

6.1.3.51 hexDigitValue()

```
int Modbus::hexDigitValue (
    int ch) [inline]
```

Returns value of hex digit [0-15] for ASCII code *ch*. or -1 if the value cannot be converted.

6.1.3.52 lrc()

```
MODBUS_EXPORT uint8_t Modbus::lrc (
    const uint8_t * byteArr,
    uint32_t count)
```

LRC checksum hash function (for [Modbus ASCII](#)).

Returns

Returns an 8-bit unsigned integer value of the checksum

6.1.3.53 modbusLibVersion()

```
MODBUS_EXPORT uint32_t Modbus::modbusLibVersion ()
```

Returns version of current lib like (major << 16) + (minor << 8) + patch.

6.1.3.54 modbusLibVersionStr()

```
MODBUS_EXPORT const Char * Modbus::modbusLibVersionStr ()
```

Returns version of current lib as string constant pointer like "major.minor.patch".

6.1.3.55 msleep()

```
MODBUS_EXPORT void Modbus::msleep (
    uint32_t msec)
```

Make current thread sleep with 'msec' milliseconds.

6.1.3.56 readMemBits() [1/2]

```

StatusCode Modbus::readMemBits (
    uint32_t offset,
    uint32_t count,
    void * values,
    const void * memBuff,
    uint32_t memBitCount) [inline]

```

Overloaded function

6.1.3.57 readMemBits() [2/2]

```

MODBUS_EXPORT StatusCode Modbus::readMemBits (
    uint32_t offset,
    uint32_t count,
    void * values,
    const void * memBuff,
    uint32_t memBitCount,
    uint32_t * outCount)

```

Function for copy (read) values from memory input `memBuff` and put it to the output buffer `values` for discretes (bits):

Parameters

in	<i>offset</i>	Memory offset to read from <code>memBuff</code> in bit size.
in	<i>count</i>	Count of bits to read from memory <code>memBuff</code> .
out	<i>values</i>	Output buffer to store data.
in	<i>memBuff</i>	Pointer to the memory which holds data.
in	<i>memBitCount</i>	Size of memory buffer <code>memBuff</code> in bits.
out	<i>outCount</i>	Optional, can be NULL. If specified, then if the requested amount of memory exceeds the limits of this memory, the error is not returned, and the amount of memory read is reduced to the memory limits and this new amount is returned in <code>outCount</code>

6.1.3.58 readMemRegs() [1/2]

```

StatusCode Modbus::readMemRegs (
    uint32_t offset,
    uint32_t count,
    void * values,
    const void * memBuff,
    uint32_t memRegCount) [inline]

```

Overloaded function

6.1.3.59 readMemRegs() [2/2]

```
MODBUS_EXPORT StatusCode Modbus::readMemRegs (
    uint32_t offset,
    uint32_t count,
    void * values,
    const void * memBuff,
    uint32_t memRegCount,
    uint32_t * outCount)
```

Function for copy (read) values from memory input `memBuff` and put it to the output buffer `values` for 16 bit registers:

Parameters

in	<i>offset</i>	Memory offset to read from <code>memBuff</code> in 16-bit registers size.
in	<i>count</i>	Count of 16-bit registers to read from memory <code>memBuff</code> .
out	<i>values</i>	Output buffer to store data.
in	<i>memBuff</i>	Pointer to the memory which holds data.
in	<i>memRegCount</i>	Size of memory buffer <code>memBuff</code> in 16-bit registers.
out	<i>outCount</i>	Optional, can be NULL. If specified, then if the requested amount of memory exceeds the limits of this memory, the error is not returned, and the amount of memory read is reduced to the memory limits and this new amount is returned in <code>outCount</code>

6.1.3.60 sascii()

```
MODBUS_EXPORT Char * Modbus::sascii (
    const uint8_t * buff,
    uint32_t count,
    Char * str,
    uint32_t strmaxlen)
```

Make string representation of ASCII array and separate bytes by space

6.1.3.61 sbaudRate()

```
MODBUS_EXPORT const Char * Modbus::sbaudRate (
    int32_t baudRate)
```

Returns pointer to constant string value that represent `int32_t` baud rate value or nullptr (NULL) if the value is invalid.

See also

[availableBaudRate\(\)](#)

6.1.3.62 sbytes()

```
MODBUS_EXPORT Char * Modbus::sbytes (
    const uint8_t * buff,
    uint32_t count,
    Char * str,
    uint32_t strmaxlen)
```

Make string representation of bytes array and separate bytes by space

6.1.3.63 sdataBits()

```
MODBUS_EXPORT const Char * Modbus::sdataBits (
    int8_t dataBits)
```

Returns pointer to constant string value that represent name of the data bits value ("8", "7", "6" or "5") or nullptr (NULL) if the value is invalid.

See also

[availableDataBits\(\)](#)

6.1.3.64 setBit()

```
void Modbus::setBit (
    void * bitBuff,
    uint16_t bitNum,
    bool value) [inline]
```

Sets the value of the bit with the number 'bitNum' to the bit array 'bitBuff'.

6.1.3.65 setBitS()

```
void Modbus::setBitS (
    void * bitBuff,
    uint16_t bitNum,
    bool value,
    uint16_t maxBitCount) [inline]
```

Sets the value of the bit with the number 'bitNum' to the bit array 'bitBuff', controlling the size of the array 'maxBitCount' in bits.

6.1.3.66 setBits()

```
void * Modbus::setBits (
    void * bitBuff,
    uint16_t bitNum,
    uint16_t bitCount,
    const bool * boolBuff) [inline]
```

Sets the values of the bits in the `bitBuff` array starting with the number `bitNum` and the count `bitCount` from the `boolBuff` array, where the value of each bit is stored as a separate `bool` value.

Returns

A pointer to the `bitBuff` array.

6.1.3.67 setBitsS()

```
void * Modbus::setBitsS (
    void * bitBuff,
    uint16_t bitNum,
    uint16_t bitCount,
    const bool * boolBuff,
    uint16_t maxBitCount) [inline]
```

Similar to the `Modbus::setBits(void*,uint16_t,uint16_t,const bool*)` function, but it is controlled that the size does not exceed the maximum number of bits `maxBitCount`.

Returns

A pointer to the `bitBuff` array.

6.1.3.68 setConsoleColor()

```
MODBUS_EXPORT void Modbus::setConsoleColor (
    Color color)
```

Set color of console text.

6.1.3.69 setSettingBaudRate()

```
MODBUS_EXPORT void Modbus::setSettingBaudRate (
    Settings & s,
    int32_t v)
```

Set settings value for the serial port's baud rate.

6.1.3.70 setSettingBroadcastEnabled()

```
MODBUS_EXPORT void Modbus::setSettingBroadcastEnabled (
    Settings & s,
    bool v)
```

Set settings value for the serial port enables broadcast mode for 0 unit address.

6.1.3.71 setSettingDataBits()

```
MODBUS_EXPORT void Modbus::setSettingDataBits (
    Settings & s,
    int8_t v)
```

Set settings value for the serial port's data bits.

6.1.3.72 setSettingFlowControl()

```
MODBUS_EXPORT void Modbus::setSettingFlowControl (  
    Settings & s,  
    FlowControl v)
```

Set settings value for the serial port's flow control.

6.1.3.73 setSettingHost()

```
MODBUS_EXPORT void Modbus::setSettingHost (  
    Settings & s,  
    const QString & v)
```

Set settings value for the IP address or DNS name of the remote device.

6.1.3.74 setSettingMaxconn()

```
MODBUS_EXPORT void Modbus::setSettingMaxconn (  
    Settings & s,  
    uint32_t v)
```

Set settings value for maximum number of simultaneous connections to the server.

6.1.3.75 setSettingParity()

```
MODBUS_EXPORT void Modbus::setSettingParity (  
    Settings & s,  
    Parity v)
```

Set settings value for the serial port's parity.

6.1.3.76 setSettingPort()

```
MODBUS_EXPORT void Modbus::setSettingPort (  
    Settings & s,  
    uint16_t v)
```

Set settings value for the TCP port number of the remote device.

6.1.3.77 setSettingSerialPortName()

```
MODBUS_EXPORT void Modbus::setSettingSerialPortName (  
    Settings & s,  
    const QString & v)
```

Set settings value for the serial port name.

6.1.3.78 setSettingStopBits()

```
MODBUS_EXPORT void Modbus::setSettingStopBits (  
    Settings & s,  
    StopBits v)
```

Set settings value for the serial port's stop bits.

6.1.3.79 setSettingTimeout()

```
MODBUS_EXPORT void Modbus::setSettingTimeout (  
    Settings & s,  
    uint32_t v)
```

Set settings value for connection timeout (milliseconds).

6.1.3.80 setSettingTimeoutFirstByte()

```
MODBUS_EXPORT void Modbus::setSettingTimeoutFirstByte (  
    Settings & s,  
    uint32_t v)
```

Set settings value for the serial port's timeout waiting first byte of packet.

6.1.3.81 setSettingTimeoutInterByte()

```
MODBUS_EXPORT void Modbus::setSettingTimeoutInterByte (  
    Settings & s,  
    uint32_t v)
```

Set settings value for the serial port's timeout waiting next byte of packet.

6.1.3.82 setSettingTries()

```
MODBUS_EXPORT void Modbus::setSettingTries (  
    Settings & s,  
    uint32_t )
```

Set settings value for number of tries a [Modbus](#) request is repeated if it fails.

6.1.3.83 setSettingType()

```
MODBUS_EXPORT void Modbus::setSettingType (  
    Settings & s,  
    ProtocolType v)
```

Set settings value the type of [Modbus](#) protocol.

6.1.3.84 setSettingUnit()

```
MODBUS_EXPORT void Modbus::setSettingUnit (
    Settings & s,
    uint8_t v)
```

Set settings value for the unit number of remote device.

6.1.3.85 sflowControl()

```
MODBUS_EXPORT const Char * Modbus::sflowControl (
    FlowControl flowControl)
```

Returns pointer to constant string value that represent name of the `FlowControl` parameter or nullptr (NULL) if the value is invalid.

See also

[availableFlowControl\(\)](#)

6.1.3.86 sparity()

```
MODBUS_EXPORT const Char * Modbus::sparity (
    Parity parity)
```

Returns pointer to constant string value that represent name of the `Parity` value or nullptr (NULL) if the value is invalid.

See also

[availableParity\(\)](#)

6.1.3.87 sproTOCOLType()

```
MODBUS_EXPORT const Char * Modbus::sproTOCOLType (
    ProtocolType type)
```

Returns pointer to constant string value that represent name of the `ProtocolType` value or nullptr (NULL) if the value is invalid.

6.1.3.88 sstopBits()

```
MODBUS_EXPORT const Char * Modbus::sstopBits (
    StopBits stopBits)
```

Returns pointer to constant string value that represent name of the `StopBits` value or nullptr (NULL) if the value is invalid.

See also

[availableStopBits\(\)](#)

6.1.3.89 `startsWith()`

```
template<typename StringT >
bool Modbus::startsWith (
    const StringT & s,
    const char * prefix)
```

Returns true if string `s` starts with `prefix`.

6.1.3.90 `StatusIsBad()`

```
bool Modbus::StatusIsBad (
    StatusCode status) [inline]
```

Returns a general indication that the operation result is unsuccessful.

6.1.3.91 `StatusIsGood()`

```
bool Modbus::StatusIsGood (
    StatusCode status) [inline]
```

Returns a general indication that the operation result is successful.

6.1.3.92 `StatusIsProcessing()`

```
bool Modbus::StatusIsProcessing (
    StatusCode status) [inline]
```

Returns a general indication that the result of the operation is incomplete.

6.1.3.93 `StatusIsStandardError()`

```
bool Modbus::StatusIsStandardError (
    StatusCode status) [inline]
```

Returns a general sign that the result is standard error.

6.1.3.94 `StatusIsUncertain()`

```
bool Modbus::StatusIsUncertain (
    StatusCode status) [inline]
```

Returns a general sign that the result of the operation is undefined.

6.1.3.95 `timer()`

```
MODBUS_EXPORT Timer Modbus::timer ()
```

Get timer value in milliseconds.

6.1.3.96 toBaudRate() [1/2]

```
MODBUS_EXPORT int32_t Modbus::toBaudRate (
    const QString & s,
    bool * ok = nullptr)
```

Converts string representation to `BaudRate` value. If `ok` is not `nullptr`, failure is reported by setting `*ok` to false, and success by setting `*ok` to true.

6.1.3.97 toBaudRate() [2/2]

```
MODBUS_EXPORT int32_t Modbus::toBaudRate (
    const QVariant & v,
    bool * ok = nullptr)
```

Converts `QVariant` value to `DataBits` value. If `ok` is not `nullptr`, failure is reported by setting `*ok` to false, and success by setting `*ok` to true.

6.1.3.98 tobaudRate()

```
MODBUS_EXPORT int32_t Modbus::tobaudRate (
    const Char * s)
```

Converts string representation to `int32_t` baud rate value or returns -1 if value cannot be converted.

6.1.3.99 toBinString()

```
template<class StringT , class T >
StringT Modbus::toBinString (
    T value)
```

Convert integer value to oct string representation with leading zeroes.

6.1.3.100 toDataBits() [1/2]

```
MODBUS_EXPORT int8_t Modbus::toDataBits (
    const QString & s,
    bool * ok = nullptr)
```

Converts string representation to `DataBits` value. If `ok` is not `nullptr`, failure is reported by setting `*ok` to false, and success by setting `*ok` to true.

6.1.3.101 toDataBits() [2/2]

```
MODBUS_EXPORT int8_t Modbus::toDataBits (
    const QVariant & v,
    bool * ok = nullptr)
```

Converts `QVariant` value to `DataBits` value. If `ok` is not `nullptr`, failure is reported by setting `*ok` to false, and success by setting `*ok` to true.

6.1.3.102 todataBits()

```
MODBUS_EXPORT int8_t Modbus::todataBits (  
    const Char * s)
```

Converts string representation to data bits `int8_t` value or returns -1 if value cannot be converted.

6.1.3.103 toDecString() [1/2]

```
template<class StringT , class T >  
StringT Modbus::toDecString (  
    T value)
```

Convert integer value to dec string representation.

6.1.3.104 toDecString() [2/2]

```
template<class StringT , class T >  
StringT Modbus::toDecString (  
    T value,  
    int c,  
    char fillChar = '0')
```

Convert integer value to dec string representation for `c`-count symbols with left digits filled with `fillChar`.

6.1.3.105 toFlowControl() [1/2]

```
MODBUS_EXPORT FlowControl Modbus::toFlowControl (  
    const QString & s,  
    bool * ok = nullptr)
```

Converts string representation to `FlowControl` enum value. If `ok` is not `nullptr`, failure is reported by setting `*ok` to false, and success by setting `*ok` to true.

6.1.3.106 toFlowControl() [2/2]

```
MODBUS_EXPORT FlowControl Modbus::toFlowControl (  
    const QVariant & v,  
    bool * ok = nullptr)
```

Converts `QVariant` value to `FlowControl` enum value. If `ok` is not `nullptr`, failure is reported by setting `*ok` to false, and success by setting `*ok` to true.

6.1.3.107 toflowControl()

```
MODBUS_EXPORT FlowControl Modbus::toflowControl (  
    const Char * s)
```

Converts string representation to `FlowControl` value or returns -1 if value cannot be converted.

6.1.3.108 toHexString()

```
template<class StringT , class T >
StringT Modbus::toHexString (
    T value)
```

Convert integer value to hex string representation with upper case and leading zeroes.

6.1.3.109 toModbusOffset()

```
uint16_t Modbus::toModbusOffset (
    uint32_t adr) [inline]
```

Function extract only offset part from [Modbus](#) address and returns it.

6.1.3.110 toModbusString()

```
String Modbus::toModbusString (
    int val) [inline]
```

Convert interger value to [Modbus::String](#)

Returns

Returns new [Modbus::String](#) value

6.1.3.111 toOctString()

```
template<class StringT , class T >
StringT Modbus::toOctString (
    T value)
```

Convert integer value to oct string representation with leading zeroes.

6.1.3.112 toParity() [1/2]

```
MODBUS_EXPORT Parity Modbus::toParity (
    const QString & s,
    bool * ok = nullptr)
```

Converts string representation to `Parity` enum value. If `ok` is not `nullptr`, failure is reported by setting `*ok` to false, and success by setting `*ok` to true.

6.1.3.113 toParity() [2/2]

```
MODBUS_EXPORT Parity Modbus::toParity (
    const QVariant & v,
    bool * ok = nullptr)
```

Converts `QVariant` value to `Parity` enum value. If `ok` is not `nullptr`, failure is reported by setting `*ok` to false, and success by setting `*ok` to true.

6.1.3.114 toparity()

```
MODBUS_EXPORT Parity Modbus::toparity (  
    const Char * s)
```

Converts string representation to Parity value or returns -1 if value cannot be converted.

6.1.3.115 toProtocolType() [1/2]

```
MODBUS_EXPORT ProtocolType Modbus::toProtocolType (  
    const QString & s,  
    bool * ok = nullptr)
```

Converts string representation to ProtocolType enum value. If ok is not nullptr, failure is reported by setting *ok to false, and success by setting *ok to true.

6.1.3.116 toProtocolType() [2/2]

```
MODBUS_EXPORT ProtocolType Modbus::toProtocolType (  
    const QVariant & v,  
    bool * ok = nullptr)
```

Converts QVariant value to ProtocolType enum value. If ok is not nullptr, failure is reported by setting *ok to false, and success by setting *ok to true.

6.1.3.117 toprotocolType()

```
MODBUS_EXPORT ProtocolType Modbus::toprotocolType (  
    const Char * s)
```

Converts string representation to ProtocolType value or returns -1 if value cannot be converted.

6.1.3.118 toStopBits() [1/2]

```
MODBUS_EXPORT StopBits Modbus::toStopBits (  
    const QString & s,  
    bool * ok = nullptr)
```

Converts string representation to StopBits enum value. If ok is not nullptr, failure is reported by setting *ok to false, and success by setting *ok to true.

6.1.3.119 toStopBits() [2/2]

```
MODBUS_EXPORT StopBits Modbus::toStopBits (  
    const QVariant & v,  
    bool * ok = nullptr)
```

Converts QVariant value to StopBits enum value. If ok is not nullptr, failure is reported by setting *ok to false, and success by setting *ok to true.

6.1.3.120 tostopBits()

```
MODBUS_EXPORT StopBits Modbus::tostopBits (  
    const Char * s)
```

Converts string representation to `StopBits` value or returns -1 if value cannot be converted.

6.1.3.121 toString() [1/5]

```
MODBUS_EXPORT QString Modbus::toString (  
    FlowControl v)
```

Returns string representation of `FlowControl` enum value

6.1.3.122 toString() [2/5]

```
MODBUS_EXPORT QString Modbus::toString (  
    Parity v)
```

Returns string representation of `Parity` enum value

6.1.3.123 toString() [3/5]

```
MODBUS_EXPORT QString Modbus::toString (  
    ProtocolType v)
```

Returns string representation of `ProtocolType` enum value

6.1.3.124 toString() [4/5]

```
MODBUS_EXPORT QString Modbus::toString (  
    StatusCode v)
```

Returns string representation of `StatusCode` enum value

6.1.3.125 toString() [5/5]

```
MODBUS_EXPORT QString Modbus::toString (  
    StopBits v)
```

Returns string representation of `StopBits` enum value

6.1.3.126 trim()

```
MODBUS_EXPORT String Modbus::trim (  
    const String & str)
```

Returns trim white spaces from the left and right side of the string `str`

6.1.3.127 writeMemBits() [1/2]

```

StatusCode Modbus::writeMemBits (
    uint32_t offset,
    uint32_t count,
    const void * values,
    void * memBuff,
    uint32_t memBitCount) [inline]

```

Overloaded function

6.1.3.128 writeMemBits() [2/2]

```

MODBUS_EXPORT StatusCode Modbus::writeMemBits (
    uint32_t offset,
    uint32_t count,
    const void * values,
    void * memBuff,
    uint32_t memBitCount,
    uint32_t * outCount)

```

Function for copy (write) values from input buffer `values` to memory `memBuff` for discretes (bits):

Parameters

in	<i>offset</i>	Memory offset to write to <code>memBuff</code> in bit size.
in	<i>count</i>	Count of bits to write into memory <code>memBuff</code> .
out	<i>values</i>	Input buffer that holds data to write.
in	<i>memBuff</i>	Pointer to the memory buffer.
in	<i>memBitCount</i>	Size of memory buffer <code>memBuff</code> in bits.
out	<i>outCount</i>	Optional, can be NULL. If specified, then if the requested amount of memory exceeds the limits of this memory, the error is not returned, and the amount of memory write is reduced to the memory limits and this new amount is returned in <code>outCount</code>

6.1.3.129 writeMemRegs() [1/2]

```

StatusCode Modbus::writeMemRegs (
    uint32_t offset,
    uint32_t count,
    const void * values,
    void * memBuff,
    uint32_t memRegCount) [inline]

```

Overloaded function

6.1.3.130 writeMemRegs() [2/2]

```

MODBUS_EXPORT StatusCode Modbus::writeMemRegs (
    uint32_t offset,
    uint32_t count,
    const void * values,
    void * memBuff,
    uint32_t memRegCount,
    uint32_t * outCount)

```

Function for copy (write) values from input buffer `values` to memory `memBuff` for 16 bit registers:

Parameters

in	<i>offset</i>	Memory offset to write to <code>memBuff</code> in 16-bit registers size.
in	<i>count</i>	Count of 16-bit registers to write into memory <code>memBuff</code> .
out	<i>values</i>	Input buffer that holds data to write.
in	<i>memBuff</i>	Pointer to the memory buffer.
in	<i>memRegCount</i>	Size of memory buffer <code>memBuff</code> in 16-bit registers.
out	<i>outCount</i>	Optional, can be NULL. If specified, then if the requested amount of memory exceeds the limits of this memory, the error is not returned, and the amount of memory write is reduced to the memory limits and this new amount is returned in <code>outCount</code>

Chapter 7

Class Documentation

7.1 Modbus::Address Class Reference

[Modbus](#) Data [Address](#) class. Represents [Modbus](#) Data [Address](#).

```
#include <Modbus.h>
```

Public Types

- enum [Notation](#) { [Notation_Default](#) , [Notation_Modbus](#) , [Notation_IEC61131](#) , [Notation_IEC61131Hex](#) }
Type of [Modbus](#) Data [Address](#) notation.

Public Member Functions

- [Address](#) ()
- [Address](#) ([Modbus::MemoryType](#) type, uint16_t offset)
- [Address](#) (uint32_t adr)
- bool [isValid](#) () const
- [Modbus::MemoryType](#) type () const
- uint16_t [offset](#) () const
- void [setOffset](#) (uint16_t offset)
- uint32_t [number](#) () const
- void [setNumber](#) (uint16_t number)
- int [toInt](#) () const
- operator uint32_t () const
- [Address](#) & [operator=](#) (uint32_t v)
- [Address](#) & [operator+=](#) (uint16_t c)
- template<class StringT >
StringT [toString](#) ([Notation](#) notation) const

Static Public Member Functions

- template<class StringT >
static [Address](#) [fromString](#) (const StringT &s)
Make modbus address from string representaion.

7.1.1 Detailed Description

[Modbus Data Address](#) class. Represents [Modbus Data Address](#).

[Address](#) class is used to represent [Modbus Data Address](#). It contains memory type and offset. E.g. `Address(Modbus::Memory_4x, 0)` creates 400001 standard address. E.g. `Address(400001)` creates [Address](#) with type `Modbus::Memory_4x` and offset 0, and `Address(1)` creates [Address](#) with type `Modbus::Memory_0x` and offset 0. Class provides conversions from/to String using template methods for this. template `<class StringT> - StringT` can be `std::basic_string` or `QString`.

7.1.2 Member Enumeration Documentation

7.1.2.1 Notation

enum `Modbus::Address::Notation`

Type of [Modbus Data Address](#) notation.

Enumerator

Notation_Default	Default notation which is equal to Modbus notation.
Notation_Modbus	Standard Modbus address notation like 000001, 100001, 300001, 400001
Notation_IEC61131	IEC-61131 address notation like %Q0, %I0, %IW0, %MW0
Notation_IEC61131Hex	IEC-61131 Hex address notation like %Q0000h, %I0000h, %IW0000h, %MW0000h

7.1.3 Constructor & Destructor Documentation

7.1.3.1 Address() [1/3]

```
Modbus::Address::Address () [inline]
```

Default constructor of the class. Creates invalid [Modbus Data Address](#)

7.1.3.2 Address() [2/3]

```
Modbus::Address::Address (
    Modbus::MemoryType type,
    uint16_t offset) [inline]
```

Constructor of the class. E.g. `Address(Modbus::Memory_4x, 0)` creates 400001 standard address.

7.1.3.3 Address() [3/3]

```
Modbus::Address::Address (
    uint32_t adr) [inline]
```

Constructor of the class. E.g. `Address(400001)` creates [Address](#) with type `Modbus::Memory_4x` and offset 0, and `Address(1)` creates [Address](#) with type `Modbus::Memory_0x` and offset 0.

7.1.4 Member Function Documentation

7.1.4.1 isValid()

```
bool Modbus::Address::isValid () const [inline]
```

Returns `true` if memory type is not `Modbus::Memory_Unknown`, `false` otherwise

7.1.4.2 number()

```
uint32_t Modbus::Address::number () const [inline]
```

Returns memory number (offset+1) of `Modbus Data Address`

7.1.4.3 offset()

```
uint16_t Modbus::Address::offset () const [inline]
```

Returns memory offset of `Modbus Data Address`

7.1.4.4 operator uint32_t()

```
Modbus::Address::operator uint32_t () const [inline]
```

Converts current `Modbus Data Address` to `uint32`, e.g. `Address (Modbus::Memory_4x, 0)` will be converted to `400001`.

7.1.4.5 operator+=()

```
Address & Modbus::Address::operator+= (
    uint16_t c) [inline]
```

Add operator definition. Increase address offset by `c` value

7.1.4.6 operator=()

```
Address & Modbus::Address::operator= (
    uint32_t v) [inline]
```

Assignment operator definition.

7.1.4.7 setNumber()

```
void Modbus::Address::setNumber (
    uint16_t number) [inline]
```

Set memory number of `Modbus Data Address`

7.1.4.8 setOffset()

```
void Modbus::Address::setOffset (
    uint16_t offset) [inline]
```

Set memory offset of [Modbus Data Address](#)

7.1.4.9 toInt()

```
int Modbus::Address::toInt () const [inline]
```

Returns int repr of [Modbus Data Address](#) e.g. `Address (Modbus::Memory_4x, 0)` will be converted to 400001.

7.1.4.10 toString()

```
template<class StringT >
StringT Modbus::Address::toString (
    Notation notation) const [inline]
```

Returns string repr of [Modbus Data Address](#) e.g. `Address (Modbus::Memory_4x, 0)` will be converted to `QString("400001")`.

7.1.4.11 type()

```
Modbus::MemoryType Modbus::Address::type () const [inline]
```

Returns memory type of [Modbus Data Address](#)

The documentation for this class was generated from the following file:

- `C:/Users/march/Dropbox/PRJ/ModbusLib/src/Modbus.h`

7.2 Modbus::Defaults Class Reference

Holds the default values of the settings.

```
#include <ModbusQt.h>
```

Public Member Functions

- [Defaults \(\)](#)

Static Public Member Functions

- static const [Defaults](#) & [instance](#) ()

Public Attributes

- `const uint8_t unit`
Default value for the unit number of remote device.
- `const ProtocolType type`
Default value for the type of [Modbus](#) protocol.
- `const uint32_t tries`
Default value for number of tries a [Modbus](#) request is repeated if it fails.
- `const QString host`
Default value for the IP address or DNS name of the remote device.
- `const uint16_t port`
Default value for the TCP port number of the remote device.
- `const uint32_t timeout`
Default value for connection timeout (milliseconds)
- `const uint32_t maxconn`
Default value for the maximum number of simultaneous connections to the server.
- `const QString serialPortName`
Default value for the serial port name.
- `const int32_t baudRate`
Default value for the serial port's baud rate.
- `const int8_t dataBits`
Default value for the serial port's data bits.
- `const Parity parity`
Default value for the serial port's parity.
- `const StopBits stopBits`
Default value for the serial port's stop bits.
- `const FlowControl flowControl`
Default value for the serial port's flow control.
- `const uint32_t timeoutFirstByte`
Default value for the serial port's timeout waiting first byte of packet.
- `const uint32_t timeoutInterByte`
Default value for the serial port's timeout waiting next byte of packet.
- `const bool isBroadcastEnabled`
Default value for the serial port enables broadcast mode for 0 unit address.

7.2.1 Detailed Description

Holds the default values of the settings.

7.2.2 Constructor & Destructor Documentation

7.2.2.1 Defaults()

```
Modbus::Defaults::Defaults ()
```

Constructor of the class.

7.2.3 Member Function Documentation

7.2.3.1 instance()

```
static const Defaults & Modbus::Defaults::instance () [static]
```

Returns a reference to the global `Modbus::Defaults` object.

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusQt.h

7.3 ModbusSerialPort::Defaults Struct Reference

Holds the default values of the settings.

```
#include <ModbusSerialPort.h>
```

Public Member Functions

- `Defaults ()`

Static Public Member Functions

Public Attributes

- const `Modbus::Char * portName`
Default value for the serial port name.
- const `int32_t baudRate`
Default value for the serial port's baud rate.
- const `int8_t dataBits`
Default value for the serial port's data bits.
- const `Modbus::Parity parity`
Default value for the serial port's patiry.
- const `Modbus::StopBits stopBits`
Default value for the serial port's stop bits.
- const `Modbus::FlowControl flowControl`
Default value for the serial port's flow control.
- const `uint32_t timeoutFirstByte`
Default value for the serial port's timeout waiting first byte of packet.
- const `uint32_t timeoutInterByte`
Default value for the serial port's timeout waiting next byte of packet.

7.3.1 Detailed Description

Holds the default values of the settings.

7.3.2 Constructor & Destructor Documentation

7.3.2.1 Defaults()

```
ModbusSerialPort::Defaults::Defaults ()
```

Constructor of the class.

7.3.3 Member Function Documentation

7.3.3.1 instance()

```
static const Defaults & ModbusSerialPort::Defaults::instance () [static]
```

Returns a reference to the global `ModbusSerialPort::Defaults` object.

The documentation for this struct was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusSerialPort.h](#)

7.4 ModbusTcpPort::Defaults Struct Reference

`Defaults` class contain default settings values for `ModbusTcpPort`.

```
#include <ModbusTcpPort.h>
```

Public Member Functions

- [Defaults](#) ()

Static Public Member Functions

- static const [Defaults](#) & [instance](#) ()

Public Attributes

- const [Modbus::Char](#) * **host**
Default setting 'TCP host name (DNS or IP address)'.
- const uint16_t **port**
Default setting 'TCP port number' for the listening server.
- const uint32_t **timeout**
Default setting for the read timeout of every single connection.

7.4.1 Detailed Description

`Defaults` class contain default settings values for `ModbusTcpPort`.

7.4.2 Constructor & Destructor Documentation

7.4.2.1 Defaults()

```
ModbusTcpPort::Defaults::Defaults ()
```

Constructor of the class.

7.4.3 Member Function Documentation

7.4.3.1 instance()

```
static const Defaults & ModbusTcpPort::Defaults::instance () [static]
```

Returns a reference to the global default value object.

The documentation for this struct was generated from the following file:

7.6.1 Detailed Description

Implements ASCII version of the [Modbus](#) communication protocol.

[ModbusAscPort](#) derived from [ModbusSerialPort](#) and implements `writeBuffer` and `readBuffer` for ASCII version of [Modbus](#) communication protocol.

7.6.2 Constructor & Destructor Documentation

7.6.2.1 [ModbusAscPort](#)()

```
ModbusAscPort::ModbusAscPort (
    bool blocking = false)
```

Constructor of the class. if `blocking = true` then defines blocking mode, non blocking otherwise.

7.6.2.2 [~ModbusAscPort](#)()

```
ModbusAscPort::~~ModbusAscPort ()
```

Destructor of the class.

7.6.3 Member Function Documentation

7.6.3.1 [readBuffer](#)()

```
Modbus::StatusCode ModbusAscPort::readBuffer (
    uint8_t & unit,
    uint8_t & func,
    uint8_t * buff,
    uint16_t maxSzBuff,
    uint16_t * szOutBuff) [override], [protected], [virtual]
```

The function parses the packet that the `read()` function puts into the buffer, checks it for correctness, extracts its parameters, and returns the status of the operation.

Implements [ModbusPort](#).

7.6.3.2 [type](#)()

```
Modbus::ProtocolType ModbusAscPort::type () const [inline], [override], [virtual]
```

Returns the [Modbus](#) protocol type. For [ModbusAscPort](#) returns `Modbus::ASC`.

Implements [ModbusPort](#).

7.6.3.3 writeBuffer()

```
Modbus::StatusCode ModbusAscPort::writeBuffer (
    uint8_t unit,
    uint8_t func,
    uint8_t * buff,
    uint16_t szInBuff) [override], [protected], [virtual]
```

The function directly generates a packet and places it in the buffer for further sending. Returns the status of the operation.

Implements [ModbusPort](#).

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusAscPort.h](#)

7.7 ModbusClient Class Reference

The [ModbusClient](#) class implements the interface of the client part of the [Modbus](#) protocol.

```
#include <ModbusClient.h>
```

Inheritance diagram for ModbusClient:

7.7.1 Detailed Description

The [ModbusClient](#) class implements the interface of the client part of the [Modbus](#) protocol.

[ModbusClient](#) contains a list of [Modbus](#) functions that are implemented by the [Modbus](#) client program. It implements functions for reading and writing different types of [Modbus](#) memory that are defined by the specification. The operations that return [Modbus::StatusCode](#) are asynchronous, that is, if the operation is not completed, it returns the intermediate status [Modbus::Status_Processing](#), and then it must be called until it is successfully completed or returns an error status.

7.7.2 Constructor & Destructor Documentation

7.7.2.1 ModbusClient()

```
ModbusClient::ModbusClient (
    uint8_t unit,
    ModbusClientPort * port)
```

Class constructor.

Parameters

in	<i>unit</i>	The address of the remote Modbus device to which this client is bound.
in	<i>port</i>	A pointer to the port object to which this client object belongs.

7.7.3 Member Function Documentation

7.7.3.1 diagnostics()

```
Modbus::StatusCode ModbusClient::diagnostics (
    uint16_t subfunc,
    uint8_t insize,
    const void * indata,
    uint8_t * outsize,
    void * outdata)
```

Same as [ModbusClientPort::diagnostics\(uint8_t unit, uint16_t subfunc, uint8_t insize, const void * indata, uint8_t * outsize, void * outdata\)](#) but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.2 getCommEventCounter()

```
Modbus::StatusCode ModbusClient::getCommEventCounter (
    uint16_t * status,
    uint16_t * eventCount)
```

Same as [ModbusClientPort::getCommEventCounter\(uint8_t unit, uint16_t *status, uint16_t *eventCount\)](#) but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.3 getCommEventLog()

```
Modbus::StatusCode ModbusClient::getCommEventLog (
    uint16_t * status,
    uint16_t * eventCount,
    uint16_t * messageCount,
    uint8_t * eventBuffSize,
    uint8_t * eventBuff)
```

Same as [ModbusClientPort::getCommEventLog\(uint8_t unit, uint16_t *status, uint16_t *eventCount, uint16_t *messageCount, uint8_t *eventBuffSize, uint8_t *eventBuff\)](#) but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.4 isOpen()

```
bool ModbusClient::isOpen () const
```

Returns `true` if communication with the remote device is established, `false` otherwise.

7.7.3.5 lastPortErrorStatus()

```
Modbus::StatusCode ModbusClient::lastPortErrorStatus () const
```

Returns the status of the last error of the performed operation.

7.7.3.6 lastPortErrorText()

```
const Modbus::Char * ModbusClient::lastPortErrorText () const
```

Returns text repr of the last error of the performed operation.

7.7.3.7 lastPortStatus()

```
Modbus::StatusCode ModbusClient::lastPortStatus () const
```

Returns the status of the last operation performed.

7.7.3.8 maskWriteRegister()

```
Modbus::StatusCode ModbusClient::maskWriteRegister (  
    uint16_t offset,  
    uint16_t andMask,  
    uint16_t orMask)
```

Same as `ModbusClientPort::writeMultipleRegisters(uint8_t unit, uint16_t offset, uint16_t andMask, uint16_t orMask)`, but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.9 port()

```
ModbusClientPort * ModbusClient::port () const
```

Returns a pointer to the port object to which this client object belongs.

7.7.3.10 readCoils()

```
Modbus::StatusCode ModbusClient::readCoils (  
    uint16_t offset,  
    uint16_t count,  
    void * values)
```

Same as `ModbusInterface::readCoils(uint8_t unit, uint16_t offset, uint16_t count, void *values)` but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.11 readCoilsAsBoolArray()

```
Modbus::StatusCode ModbusClient::readCoilsAsBoolArray (
    uint16_t offset,
    uint16_t count,
    bool * values)
```

Same as `ModbusClientPort::readCoilsAsBoolArray(uint8_t unit, uint16_t offset, uint16_t count, bool * values)` but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.12 readDiscreteInputs()

```
Modbus::StatusCode ModbusClient::readDiscreteInputs (
    uint16_t offset,
    uint16_t count,
    void * values)
```

Same as `ModbusInterface::readDiscreteInputs(uint8_t unit, uint16_t offset, uint16_t count, void * values)` but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.13 readDiscreteInputsAsBoolArray()

```
Modbus::StatusCode ModbusClient::readDiscreteInputsAsBoolArray (
    uint16_t offset,
    uint16_t count,
    bool * values)
```

Same as `ModbusClientPort::readWriteMultipleRegisters(uint8_t unit, uint16_t readOffset, uint16_t readCount, uint16_t *readValues, uint16_t writeOffset, uint16_t writeCount, const uint16_t *writeValues)`, but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.14 readExceptionStatus()

```
Modbus::StatusCode ModbusClient::readExceptionStatus (
    uint8_t * value)
```

Same as `ModbusInterface::readExceptionStatus(uint8_t unit, uint8_t *status)`, but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.15 readFIFOQueue()

```
Modbus::StatusCode ModbusClient::readFIFOQueue (
    uint16_t fifoadr,
    uint16_t * count,
    uint16_t * values)
```

Same as `ModbusClientPort::readFIFOQueue(uint8_t unit, uint16_t fifoadr, uint16_t *count, uint16_t *values)` but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.16 readHoldingRegisters()

```
Modbus::StatusCode ModbusClient::readHoldingRegisters (
    uint16_t offset,
    uint16_t count,
    uint16_t * values)
```

Same as `ModbusInterface::readHoldingRegisters(uint8_t unit, uint16_t offset, uint16_t count, uint16_t * values)` but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.17 readInputRegisters()

```
Modbus::StatusCode ModbusClient::readInputRegisters (
    uint16_t offset,
    uint16_t count,
    uint16_t * values)
```

Same as `ModbusInterface::readInputRegisters(uint8_t unit, uint16_t offset, uint16_t count, uint16_t * values)` but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.18 readWriteMultipleRegisters()

```
Modbus::StatusCode ModbusClient::readWriteMultipleRegisters (
    uint16_t readOffset,
    uint16_t readCount,
    uint16_t * readValues,
    uint16_t writeOffset,
    uint16_t writeCount,
    const uint16_t * writeValues)
```

Same as `ModbusClientPort::readWriteMultipleRegisters(uint8_t unit, uint16_t offset, uint16_t count, const uint16_t * values)`, but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.19 reportServerID()

```
Modbus::StatusCode ModbusClient::reportServerID (
    uint8_t * count,
    uint8_t * data)
```

Same as `ModbusClientPort::reportServerID(uint8_t unit, uint8_t *count, uint8_t *data)`, but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.20 setUnit()

```
void ModbusClient::setUnit (
    uint8_t unit)
```

Sets the address of the remote [Modbus](#) device to which this client is bound.

7.7.3.21 type()

```
Modbus::ProtocolType ModbusClient::type () const
```

Returns the type of the [Modbus](#) protocol.

7.7.3.22 unit()

```
uint8_t ModbusClient::unit () const
```

Returns the address of the remote [Modbus](#) device to which this client is bound.

7.7.3.23 writeMultipleCoils()

```
Modbus::StatusCode ModbusClient::writeMultipleCoils (
    uint16_t offset,
    uint16_t count,
    const void * values)
```

Same as [ModbusInterface::writeMultipleCoils\(uint8_t unit, uint16_t offset, uint16_t count, void * values\)](#) but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.24 writeMultipleCoilsAsBoolArray()

```
Modbus::StatusCode ModbusClient::writeMultipleCoilsAsBoolArray (
    uint16_t offset,
    uint16_t count,
    const bool * values)
```

Same as [ModbusClientPort::writeMultipleCoilsAsBoolArray\(uint8_t unit, uint16_t offset, uint16_t count, const bool * values\)](#) but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.25 writeMultipleRegisters()

```
Modbus::StatusCode ModbusClient::writeMultipleRegisters (
    uint16_t offset,
    uint16_t count,
    const uint16_t * values)
```

Same as [ModbusInterface::writeMultipleRegisters\(uint8_t unit, uint16_t offset, uint16_t count, const uint16_t * values\)](#) but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.26 writeSingleCoil()

```
Modbus::StatusCode ModbusClient::writeSingleCoil (
    uint16_t offset,
    bool value)
```

Same as [ModbusInterface::writeSingleCoil\(uint8_t unit, uint16_t offset, bool value\)](#), but the `unit` address of the remote [Modbus](#) device is missing. It is preset in the constructor.

7.7.3.27 writeSingleRegister()

```
Modbus::StatusCode ModbusClient::writeSingleRegister (
    uint16_t offset,
    uint16_t value)
```

Same as `ModbusInterface::writeSingleRegister(uint8_t unit, uint16_t offset, uint16_t value)` but the `unit` address of the remote `Modbus` device is missing. It is preset in the constructor.

The documentation for this class was generated from the following file:

- `C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusClient.h`

7.8 ModbusClientPort Class Reference

The `ModbusClientPort` class implements the algorithm of the client part of the `Modbus` communication protocol port.

```
#include <ModbusClientPort.h>
```

Inheritance diagram for `ModbusClientPort`:

Public Types

- enum `RequestStatus` { **Enable** , **Disable** , **Process** }

7.8.1 Detailed Description

The [ModbusClientPort](#) class implements the algorithm of the client part of the [Modbus](#) communication protocol port.

[ModbusClient](#) contains a list of [Modbus](#) functions that are implemented by the [Modbus](#) client program. It implements functions for reading and writing various types of [Modbus](#) memory defined by the specification. In the non blocking mode if the operation is not completed it returns the intermediate status [Modbus::Status_Processing](#), and then it must be called until it is successfully completed or returns an error status.

[ModbusClientPort](#) has number of [Modbus](#) functions with interface like `readCoils (ModbusObject *client, ...)`. Several clients can automatically share a current [ModbusClientPort](#) resource. The first one to access the port seizes the resource until the operation with the remote device is completed. Then the first client will release the resource and the next client in the queue will capture it, and so on in a circle.

```
#include <ModbusClient.h>
//...
void main()
{
    //...
    ModbusClientPort *port = Modbus::createClientPort (Modbus::TCP, &settings, false);
    ModbusClient c1 (1, port);
    ModbusClient c2 (2, port);
    ModbusClient c3 (3, port);
    Modbus::StatusCode s1, s2, s3;
    //...
    while (1)
    {
        s1 = c1.readHoldingRegisters (0, 10, values);
        s2 = c2.readHoldingRegisters (0, 10, values);
        s3 = c3.readHoldingRegisters (0, 10, values);
        doSomeOtherStuffInCurrentThread();
        Modbus::msleep (1);
    }
    //...
}
```

7.8.2 Constructor & Destructor Documentation

7.8.2.1 ModbusClientPort()

```
ModbusClientPort::ModbusClientPort (
    ModbusPort * port)
```

Constructor of the class.

Parameters

in	<i>port</i>	A pointer to the port object which belongs to this client object. Lifecycle of the <code>port</code> object is managed by this ModbusClientPort -object
----	-------------	---

7.8.3 Member Function Documentation

7.8.3.1 cancelRequest()

```
void ModbusClientPort::cancelRequest (
    ModbusObject * client)
```

Cancels the previous request specified by the `*rp` pointer for the client.

7.8.3.2 close()

```
Modbus::StatusCode ModbusClientPort::close ()
```

Closes connection and returns status of the operation.

7.8.3.3 currentClient()

```
const ModbusObject * ModbusClientPort::currentClient () const
```

Returns a pointer to the client object whose request is currently being processed by the current port.

7.8.3.4 diagnostics() [1/2]

```
Modbus::StatusCode ModbusClientPort::diagnostics (
    ModbusObject * client,
    uint8_t unit,
    uint16_t subfunc,
    uint8_t insize,
    const void * indata,
    uint8_t * outsize,
    void * outdata)
```

Same as `ModbusClientPort::readInputRegisters(uint8_t unit, uint16_t offset, uint16_t count)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.5 diagnostics() [2/2]

```
Modbus::StatusCode ModbusClientPort::diagnostics (
    uint8_t unit,
    uint16_t subfunc,
    uint8_t insize,
    const void * indata,
    uint8_t * outsize,
    void * outdata) [override], [virtual]
```

Function provides a series of tests for checking the communication system between a client device and a server, or for checking various internal error conditions within a server.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>subfunc</i>	Address of the remote Modbus device.
in	<i>insize</i>	Size of the input buffer (in bytes).
in	<i>indata</i>	Pointer to the buffer where the input (request) data is stored.
out	<i>outsize</i>	Size of the buffer (in bytes) where the output data is stored.
out	<i>outdata</i>	Pointer to the buffer where the output data is stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad↵IllegalFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.6 `getCommEventCounter()` [1/2]

```
Modbus::StatusCode ModbusClientPort::getCommEventCounter (
    ModbusObject * client,
    uint8_t unit,
    uint16_t * status,
    uint16_t * eventCount)
```

Same as `ModbusClientPort::getCommEventCounter(uint8_t unit, uint16_t offset, uint16_t count, uint16_t *values)` but has `client` as first parameter to seize current [ModbusClientPort](#) resource.

7.8.3.7 `getCommEventCounter()` [2/2]

```
Modbus::StatusCode ModbusClientPort::getCommEventCounter (
    uint8_t unit,
    uint16_t * status,
    uint16_t * eventCount) [override], [virtual]
```

Function is used to get a status word and an event count from the remote device's communication event counter.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
out	<i>status</i>	Returned status word.
out	<i>eventCount</i>	Returned event counter.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad↵IllegalFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.8 getCommEventLog() [1/2]

```
Modbus::StatusCode ModbusClientPort::getCommEventLog (
    ModbusObject * client,
    uint8_t unit,
    uint16_t * status,
    uint16_t * eventCount,
    uint16_t * messageCount,
    uint8_t * eventBuffSize,
    uint8_t * eventBuff)
```

Same as `ModbusClientPort::getCommEventLog(uint8_t unit, uint16_t *status, uint16_t *eventCount, uint16_t *messageCount, uint8_t *events)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.9 getCommEventLog() [2/2]

```
Modbus::StatusCode ModbusClientPort::getCommEventLog (
    uint8_t unit,
    uint16_t * status,
    uint16_t * eventCount,
    uint16_t * messageCount,
    uint8_t * eventBuffSize,
    uint8_t * eventBuff) [override], [virtual]
```

Function is used to get a status word and an event count from the remote device's communication event counter.

Parameters

in	<i>unit</i>	Address of the remote <code>Modbus</code> device.
out	<i>status</i>	Returned status word.
out	<i>eventCount</i>	Returned event counter.
out	<i>messageCount</i>	Returned message counter.
out	<i>eventBuffSize</i>	Size of the buffer where the output events (bytes) is stored.
out	<i>eventBuff</i>	Pointer to the buffer where the output events (bytes) is stored.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_Bad` ← `IllegalFunction`.

Reimplemented from `ModbusInterface`.

7.8.3.10 getRequestStatus()

```
RequestStatus ModbusClientPort::getRequestStatus (
    ModbusObject * client)
```

Returns status the current request for `client`.

The client usually calls this function to determine whether its request is pending/finished/blocked. If function returns `Enable`, `client` has just became current and can make request to the port, `Process` - current `client` is already processing, `Disable` - other client owns the port.

7.8.3.11 isBroadcastEnabled()

```
bool ModbusClientPort::isBroadcastEnabled () const
```

Returns `true` if broadcast mode for 0 unit address is enabled, `false` otherwise. Broadcast mode for 0 unit address is required by [Modbus](#) protocol so it is enabled by default

7.8.3.12 isOpen()

```
bool ModbusClientPort::isOpen () const
```

Returns `true` if the connection with the remote device is established, `false` otherwise.

7.8.3.13 lastErrorStatus()

```
Modbus::StatusCode ModbusClientPort::lastErrorStatus () const
```

Returns the status of the last error of the performed operation.

7.8.3.14 lastErrorText()

```
const Modbus::Char * ModbusClientPort::lastErrorText () const
```

Returns the text of the last error of the performed operation.

7.8.3.15 lastRepeatCount()

```
uint32_t ModbusClientPort::lastRepeatCount () const [inline]
```

Same as [lastTries\(\)](#).

7.8.3.16 lastStatus()

```
Modbus::StatusCode ModbusClientPort::lastStatus () const
```

Returns the status of the last operation performed.

7.8.3.17 lastStatusTimestamp()

```
Modbus::Timestamp ModbusClientPort::lastStatusTimestamp () const
```

Returns the timestamp of the last operation performed.

7.8.3.18 lastTries()

```
uint32_t ModbusClientPort::lastTries () const
```

Returns statistics of the count of tries already processed.

7.8.3.19 maskWriteRegister() [1/2]

```
Modbus::StatusCode ModbusClientPort::maskWriteRegister (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t andMask,
    uint16_t orMask)
```

Same as `ModbusClientPort::writeMultipleRegisters(uint8_t unit, uint16_t offset, uint16_t andMask, uint16_t orMask)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.20 maskWriteRegister() [2/2]

```
Modbus::StatusCode ModbusClientPort::maskWriteRegister (
    uint8_t unit,
    uint16_t offset,
    uint16_t andMask,
    uint16_t orMask) [override], [virtual]
```

Function is used to modify the contents of a specified holding register using a combination of an AND mask, an OR mask, and the register's current contents. The function's algorithm is: `Result = (Current Contents AND And_Mask) OR (Or_Mask AND (NOT And_Mask))`

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>andMask</i>	16-bit unsigned integer value AND mask.
in	<i>orMask</i>	16-bit unsigned integer value OR mask.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_BadRequest` or `IllegalFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.21 port()

```
ModbusPort * ModbusClientPort::port () const
```

Returns a pointer to the port object that is used by this algorithm.

7.8.3.22 readCoils() [1/2]

```
Modbus::StatusCode ModbusClientPort::readCoils (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    void * values)
```

Same as `ModbusClientPort::readCoils(uint8_t unit, uint16_t offset, uint16_t count, void * values)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.23 readCoils() [2/2]

```
Modbus::StatusCode ModbusClientPort::readCoils (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    void * values) [override], [virtual]
```

Function for read discrete outputs (coils, 0x bits).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of coils (bits).
out	<i>values</i>	Pointer to the output buffer (bit array) where the read values are stored.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_BadFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.24 readCoilsAsBoolArray() [1/2]

```
Modbus::StatusCode ModbusClientPort::readCoilsAsBoolArray (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    bool * values)
```

Same as `ModbusClientPort::readCoilsAsBoolArray(uint8_t unit, uint16_t offset, uint16_t count, bool * values)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.25 readCoilsAsBoolArray() [2/2]

```
Modbus::StatusCode ModbusClientPort::readCoilsAsBoolArray (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    bool * values) [inline]
```

Same as `ModbusClientPort::readCoils(uint8_t unit, uint16_t offset, uint16_t count, void *values)` but the output buffer of values `values` is an array, where each discrete value is located in a separate element of the array of type `bool`.

7.8.3.26 readDiscreteInputs() [1/2]

```
Modbus::StatusCode ModbusClientPort::readDiscreteInputs (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    void * values)
```

Same as `ModbusClientPort::readDiscreteInputs(uint8_t unit, uint16_t offset, uint16_t count, void *values)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.27 readDiscreteInputs() [2/2]

```
Modbus::StatusCode ModbusClientPort::readDiscreteInputs (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    void * values) [override], [virtual]
```

Function for read digital inputs (1x bits).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of inputs (bits).
out	<i>values</i>	Pointer to the output buffer (bit array) where the read values are stored.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_BadFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.28 readDiscreteInputsAsBoolArray() [1/2]

```
Modbus::StatusCode ModbusClientPort::readDiscreteInputsAsBoolArray (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    bool * values)
```

Same as `ModbusClientPort::readDiscreteInputsAsBoolArray(uint8_t unit, uint16_t offset, uint16_t count, bool * values)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.29 readDiscreteInputsAsBoolArray() [2/2]

```
Modbus::StatusCode ModbusClientPort::readDiscreteInputsAsBoolArray (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    bool * values) [inline]
```

Same as `ModbusClientPort::readDiscreteInputs(uint8_t unit, uint16_t offset, uint16_t count, bool * values)` but the output buffer of values `values` is an array, where each discrete value is located in a separate element of the array of type `bool`.

7.8.3.30 readExceptionStatus() [1/2]

```
Modbus::StatusCode ModbusClientPort::readExceptionStatus (
    ModbusObject * client,
    uint8_t unit,
    uint8_t * value)
```

Same as `ModbusClientPort::readExceptionStatus(uint8_t unit, uint8_t *status)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.31 readExceptionStatus() [2/2]

```
Modbus::StatusCode ModbusClientPort::readExceptionStatus (
    uint8_t unit,
    uint8_t * status) [override], [virtual]
```

Function to read ExceptionStatus.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
out	<i>status</i>	Pointer to the byte (bit array) where the exception status is stored.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_BadFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.32 readFIFOQueue() [1/2]

```
Modbus::StatusCode ModbusClientPort::readFIFOQueue (
    ModbusObject * client,
    uint8_t unit,
    uint16_t fifoadr,
    uint16_t * count,
    uint16_t * values)
```

Same as `ModbusClientPort::readFIFOQueue(uint8_t unit, uint16_t fifoadr, uint16_t *count, u` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.33 readFIFOQueue() [2/2]

```
Modbus::StatusCode ModbusClientPort::readFIFOQueue (
    uint8_t unit,
    uint16_t fifoadr,
    uint16_t * count,
    uint16_t * values) [override], [virtual]
```

Function for read the contents of a First-In-First-Out (FIFO) queue of register in a remote device.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>fifoadr</i>	Address of FIFO (0-based).
in	<i>count</i>	Count of registers.
out	<i>values</i>	Pointer to the output buffer where the read values are stored.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_Bad↵IllegalFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.34 readHoldingRegisters() [1/2]

```
Modbus::StatusCode ModbusClientPort::readHoldingRegisters (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    uint16_t * values)
```

Same as `ModbusClientPort::readHoldingRegisters(uint8_t unit, uint16_t offset, uint16_t cou` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.35 readHoldingRegisters() [2/2]

```
Modbus::StatusCode ModbusClientPort::readHoldingRegisters (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    uint16_t * values) [override], [virtual]
```

Function for read holding (output) 16-bit registers (4x regs).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of registers.
out	<i>values</i>	Pointer to the output buffer (bit array) where the read values are stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.36 readInputRegisters() [1/2]

```
Modbus::StatusCode ModbusClientPort::readInputRegisters (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    uint16_t * values)
```

Same as [ModbusClientPort::readInputRegisters\(uint8_t unit, uint16_t offset, uint16_t count\)](#) but has `client` as first parameter to seize current [ModbusClientPort](#) resource.

7.8.3.37 readInputRegisters() [2/2]

```
Modbus::StatusCode ModbusClientPort::readInputRegisters (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    uint16_t * values) [override], [virtual]
```

Function for read input 16-bit registers (3x regs).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of registers.
out	<i>values</i>	Pointer to the output buffer (bit array) where the read values are stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.38 readWriteMultipleRegisters() [1/2]

```
Modbus::StatusCode ModbusClientPort::readWriteMultipleRegisters (
    ModbusObject * client,
    uint8_t unit,
    uint16_t readOffset,
    uint16_t readCount,
    uint16_t * readValues,
    uint16_t writeOffset,
    uint16_t writeCount,
    const uint16_t * writeValues)
```

Same as `ModbusClientPort::readWriteMultipleRegisters(uint8_t unit, uint16_t offset, readOffset, uint16_t readCount, uint16_t *readValues, uint16_t writeOffset, uint16_t writeCount, const uint16_t *writeValues)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.39 readWriteMultipleRegisters() [2/2]

```
Modbus::StatusCode ModbusClientPort::readWriteMultipleRegisters (
    uint8_t unit,
    uint16_t readOffset,
    uint16_t readCount,
    uint16_t * readValues,
    uint16_t writeOffset,
    uint16_t writeCount,
    const uint16_t * writeValues) [override], [virtual]
```

This function code performs a combination of one read operation and one write operation in a single MODBUS transaction.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>readOffset</i>	Starting offset for read(0-based).
in	<i>readCount</i>	Count of registers to read.
out	<i>readValues</i>	Pointer to the output buffer which values must be read.
in	<i>writeOffset</i>	Starting offset for write(0-based).
in	<i>writeCount</i>	Count of registers to write.
in	<i>writeValues</i>	Pointer to the input buffer which values must be written.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_BadIllegalFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.40 repeatCount()

```
uint32_t ModbusClientPort::repeatCount () const [inline]
```

Same as `tries()`. Used for backward compatibility.

7.8.3.41 reportServerID() [1/2]

```
Modbus::StatusCode ModbusClientPort::reportServerID (
    ModbusObject * client,
    uint8_t unit,
    uint8_t * count,
    uint8_t * data)
```

Same as `ModbusClientPort::reportServerID(uint8_t unit, uint8_t *count, uint8_t *data)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.42 reportServerID() [2/2]

```
Modbus::StatusCode ModbusClientPort::reportServerID (
    uint8_t unit,
    uint8_t * count,
    uint8_t * data) [override], [virtual]
```

Function to read the description of the type, the current status, and other information specific to a remote device.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>count</i>	Count of bytes returned.
in	<i>data</i>	Pointer to the output buffer where the read data are stored.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_Bad` ← `IllegalFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.43 setBroadcastEnabled()

```
void ModbusClientPort::setBroadcastEnabled (
    bool enable)
```

Enables broadcast mode for 0 unit address. It is enabled by default.

See also

[isBroadcastEnabled\(\)](#)

7.8.3.44 setPort()

```
void ModbusClientPort::setPort (
    ModbusPort * port)
```

Set new port object for current client port control. Previous port object is deleted.

7.8.3.45 setRepeatCount()

```
void ModbusClientPort::setRepeatCount (
    uint32_t v) [inline]
```

Same as `setTries()`. Used for backward compatibility.

7.8.3.46 setTries()

```
void ModbusClientPort::setTries (
    uint32_t v)
```

Sets the number of tries a [Modbus](#) request is repeated if it fails.

7.8.3.47 signalClosed()

```
void ModbusClientPort::signalClosed (
    const Modbus::Char * source)
```

Calls each callback of the port when the port is closed. `source` - current port's name

7.8.3.48 signalError()

```
void ModbusClientPort::signalError (
    const Modbus::Char * source,
    Modbus::StatusCode status,
    const Modbus::Char * text)
```

Calls each callback of the port when error is occurred with error's status and text.

7.8.3.49 signalOpened()

```
void ModbusClientPort::signalOpened (
    const Modbus::Char * source)
```

Calls each callback of the port when the port is opened. `source` - current port's name

7.8.3.50 signalRx()

```
void ModbusClientPort::signalRx (
    const Modbus::Char * source,
    const uint8_t * buff,
    uint16_t size)
```

Calls each callback of the incoming packet 'Rx' from the internal list of callbacks, passing them the input array 'buff' and its size 'size'.

7.8.3.51 signalTx()

```
void ModbusClientPort::signalTx (
    const Modbus::Char * source,
    const uint8_t * buff,
    uint16_t size)
```

Calls each callback of the original packet 'Tx' from the internal list of callbacks, passing them the original array 'buff' and its size 'size'.

7.8.3.52 tries()

```
uint32_t ModbusClientPort::tries () const
```

Returns the setting of the number of tries of the [Modbus](#) request if it fails.

7.8.3.53 type()

```
Modbus::ProtocolType ModbusClientPort::type () const
```

Returns type of [Modbus](#) protocol.

7.8.3.54 writeMultipleCoils() [1/2]

```
Modbus::StatusCode ModbusClientPort::writeMultipleCoils (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    const void * values)
```

Same as [ModbusClientPort::writeMultipleCoils\(uint8_t unit, uint16_t offset, uint16_t count\)](#) but has `client` as first parameter to seize current [ModbusClientPort](#) resource.

7.8.3.55 writeMultipleCoils() [2/2]

```
Modbus::StatusCode ModbusClientPort::writeMultipleCoils (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    const void * values) [override], [virtual]
```

Function is used to modify the contents of a specified holding register using a combination of an AND mask, an OR mask, and the register's current contents.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of coils.
in	<i>values</i>	Pointer to the input buffer (bit array) which values must be written.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.56 writeMultipleCoilsAsBoolArray() [1/2]

```
Modbus::StatusCode ModbusClientPort::writeMultipleCoilsAsBoolArray (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    const bool * values)
```

Same as `ModbusClientPort::writeMultipleCoilsAsBoolArray(uint8_t unit, uint16_t offset, uint16_t count, const bool * values)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.57 writeMultipleCoilsAsBoolArray() [2/2]

```
Modbus::StatusCode ModbusClientPort::writeMultipleCoilsAsBoolArray (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    const bool * values) [inline]
```

Same as `ModbusClientPort::writeMultipleCoilsAsBoolArray(uint8_t unit, uint16_t offset, uint16_t count, const bool * values)` but the input buffer of values `values` is an array, where each discrete value is located in a separate element of the array of type `bool`.

7.8.3.58 writeMultipleRegisters() [1/2]

```
Modbus::StatusCode ModbusClientPort::writeMultipleRegisters (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    const uint16_t * values)
```

Same as `ModbusClientPort::writeMultipleRegisters(uint8_t unit, uint16_t offset, uint16_t count, const uint16_t * values)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.59 writeMultipleRegisters() [2/2]

```
Modbus::StatusCode ModbusClientPort::writeMultipleRegisters (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    const uint16_t * values) [override], [virtual]
```

Function for write holding (output) 16-bit registers (4x regs).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of registers.
in	<i>values</i>	Pointer to the input buffer which values must be written.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_BadFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.60 writeSingleCoil() [1/2]

```
Modbus::StatusCode ModbusClientPort::writeSingleCoil (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    bool value)
```

Same as `ModbusClientPort::writeSingleCoil(uint8_t unit, uint16_t offset, bool value)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.61 writeSingleCoil() [2/2]

```
Modbus::StatusCode ModbusClientPort::writeSingleCoil (
    uint8_t unit,
    uint16_t offset,
    bool value) [override], [virtual]
```

Function for write one separate discrete output (0x coil).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>value</i>	Boolean value to be set.

Returns

The result `Modbus::StatusCode` of the operation. Default implementation returns `Status_BadFunction`.

Reimplemented from [ModbusInterface](#).

7.8.3.62 writeSingleRegister() [1/2]

```
Modbus::StatusCode ModbusClientPort::writeSingleRegister (
    ModbusObject * client,
    uint8_t unit,
    uint16_t offset,
    uint16_t value)
```

Same as `ModbusClientPort::writeSingleRegister(uint8_t unit, uint16_t offset, uint16_t value)` but has `client` as first parameter to seize current `ModbusClientPort` resource.

7.8.3.63 writeSingleRegister() [2/2]

```
Modbus::StatusCode ModbusClientPort::writeSingleRegister (
    uint8_t unit,
    uint16_t offset,
    uint16_t value) [override], [virtual]
```

Function for write one separate 16-bit holding register (4x).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>value</i>	16-bit unsigned integer value to be set.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_BadFunction`.

Reimplemented from [ModbusInterface](#).

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusClientPort.h](#)

7.9 ModbusInterface Class Reference

Main interface of [Modbus](#) communication protocol.

```
#include <Modbus.h>
```

7.9.1 Detailed Description

Main interface of [Modbus](#) communication protocol.

[ModbusInterface](#) contains list of functions that [ModbusLib](#) is supported. There are such functions as↵
 : 1 (0x01) - READ_COILS 2 (0x02) - READ_DISCRETE_INPUTS 3 (0x03) - READ_HOLDING_REGISTERS
 4 (0x04) - READ_INPUT_REGISTERS 5 (0x05) - WRITE_SINGLE_COIL 6 (0x06) - WRITE_SINGLE_↵
 REGISTER 7 (0x07) - READ_EXCEPTION_STATUS 8 (0x08) - DIAGNOSTICS 11 (0x0B) - GET_COMM_↵
 EVENT_COUNTER 12 (0x0C) - GET_COMM_EVENT_LOG 15 (0x0F) - WRITE_MULTIPLE_COILS 16 (0x10) -
 WRITE_MULTIPLE_REGISTERS 17 (0x11) - REPORT_SERVER_ID 22 (0x16) - MASK_WRITE_REGISTER
 23 (0x17) - READ_WRITE_MULTIPLE_REGISTERS 24 (0x18) - READ_FIFO_QUEUE

Default implementation of every [Modbus](#) function returns [Modbus::Status_BadIllegalFunction](#).

7.9.2 Member Function Documentation

7.9.2.1 diagnostics()

```
virtual Modbus::StatusCode ModbusInterface::diagnostics (
    uint8_t unit,
    uint16_t subfunc,
    uint8_t insize,
    const void * indata,
    uint8_t * outsize,
    void * outdata) [virtual]
```

Function provides a series of tests for checking the communication system between a client device and a server, or for checking various internal error conditions within a server.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>subfunc</i>	Address of the remote Modbus device.
in	<i>insize</i>	Size of the input buffer (in bytes).
in	<i>indata</i>	Pointer to the buffer where the input (request) data is stored.
out	<i>outsize</i>	Size of the buffer (in bytes) where the output data is stored.
out	<i>outdata</i>	Pointer to the buffer where the output data is stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns [Status_Bad↵
IllegalFunction](#).

Reimplemented in [ModbusClientPort](#).

7.9.2.2 getCommEventCounter()

```
virtual Modbus::StatusCode ModbusInterface::getCommEventCounter (
    uint8_t unit,
    uint16_t * status,
    uint16_t * eventCount) [virtual]
```

Function is used to get a status word and an event count from the remote device's communication event counter.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
out	<i>status</i>	Returned status word.
out	<i>eventCount</i>	Returned event counter.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.3 getCommEventLog()

```
virtual Modbus::StatusCode ModbusInterface::getCommEventLog (
    uint8_t unit,
    uint16_t * status,
    uint16_t * eventCount,
    uint16_t * messageCount,
    uint8_t * eventBuffSize,
    uint8_t * eventBuff) [virtual]
```

Function is used to get a status word and an event count from the remote device's communication event counter.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
out	<i>status</i>	Returned status word.
out	<i>eventCount</i>	Returned event counter.
out	<i>messageCount</i>	Returned message counter.
out	<i>eventBuffSize</i>	Size of the buffer where the output events (bytes) is stored.
out	<i>eventBuff</i>	Pointer to the buffer where the output events (bytes) is stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.4 maskWriteRegister()

```
virtual Modbus::StatusCode ModbusInterface::maskWriteRegister (
    uint8_t unit,
    uint16_t offset,
    uint16_t andMask,
    uint16_t orMask) [virtual]
```

Function is used to modify the contents of a specified holding register using a combination of an AND mask, an OR mask, and the register's current contents. The function's algorithm is: `Result = (Current Contents AND And_Mask) OR (Or_Mask AND (NOT And_Mask))`

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>andMask</i>	16-bit unsigned integer value AND mask.
in	<i>orMask</i>	16-bit unsigned integer value OR mask.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.5 readCoils()

```
virtual Modbus::StatusCode ModbusInterface::readCoils (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    void * values) [virtual]
```

Function for read discrete outputs (coils, 0x bits).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of coils (bits).
out	<i>values</i>	Pointer to the output buffer (bit array) where the read values are stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.6 readDiscreteInputs()

```
virtual Modbus::StatusCode ModbusInterface::readDiscreteInputs (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    void * values) [virtual]
```

Function for read digital inputs (1x bits).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of inputs (bits).
out	<i>values</i>	Pointer to the output buffer (bit array) where the read values are stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad↵`
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.7 readExceptionStatus()

```
virtual Modbus::StatusCode ModbusInterface::readExceptionStatus (
    uint8_t unit,
    uint8_t * status) [virtual]
```

Function to read ExceptionStatus.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
out	<i>status</i>	Pointer to the byte (bit array) where the exception status is stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad↵`
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.8 readFIFOQueue()

```
virtual Modbus::StatusCode ModbusInterface::readFIFOQueue (
    uint8_t unit,
    uint16_t fifoadr,
    uint16_t * count,
    uint16_t * values) [virtual]
```

Function for read the contents of a First-In-First-Out (FIFO) queue of register in a remote device.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>fifoadr</i>	Address of FIFO (0-based).
in	<i>count</i>	Count of registers.
out	<i>values</i>	Pointer to the output buffer where the read values are stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad↵`
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.9 readHoldingRegisters()

```
virtual Modbus::StatusCode ModbusInterface::readHoldingRegisters (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    uint16_t * values) [virtual]
```

Function for read holding (output) 16-bit registers (4x regs).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of registers.
out	<i>values</i>	Pointer to the output buffer (bit array) where the read values are stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.10 readInputRegisters()

```
virtual Modbus::StatusCode ModbusInterface::readInputRegisters (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    uint16_t * values) [virtual]
```

Function for read input 16-bit registers (3x regs).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of registers.
out	<i>values</i>	Pointer to the output buffer (bit array) where the read values are stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.11 readWriteMultipleRegisters()

```
virtual Modbus::StatusCode ModbusInterface::readWriteMultipleRegisters (
    uint8_t unit,
    uint16_t readOffset,
    uint16_t readCount,
    uint16_t * readValues,
    uint16_t writeOffset,
    uint16_t writeCount,
    const uint16_t * writeValues) [virtual]
```

This function code performs a combination of one read operation and one write operation in a single MODBUS transaction.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>readOffset</i>	Starting offset for read(0-based).
in	<i>readCount</i>	Count of registers to read.
out	<i>readValues</i>	Pointer to the output buffer which values must be read.
in	<i>writeOffset</i>	Starting offset for write(0-based).
in	<i>writeCount</i>	Count of registers to write.
in	<i>writeValues</i>	Pointer to the input buffer which values must be written.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad↵IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.12 reportServerID()

```
virtual Modbus::StatusCode ModbusInterface::reportServerID (
    uint8_t unit,
    uint8_t * count,
    uint8_t * data) [virtual]
```

Function to read the description of the type, the current status, and other information specific to a remote device.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>count</i>	Count of bytes returned.
in	<i>data</i>	Pointer to the output buffer where the read data are stored.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad↵IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.13 writeMultipleCoils()

```
virtual Modbus::StatusCode ModbusInterface::writeMultipleCoils (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    const void * values) [virtual]
```

Function is used to modify the contents of a specified holding register using a combination of an AND mask, an OR mask, and the register's current contents.

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of coils.
in	<i>values</i>	Pointer to the input buffer (bit array) which values must be written.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.14 writeMultipleRegisters()

```
virtual Modbus::StatusCode ModbusInterface::writeMultipleRegisters (
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    const uint16_t * values) [virtual]
```

Function for write holding (output) 16-bit registers (4x regs).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>count</i>	Count of registers.
in	<i>values</i>	Pointer to the input buffer which values must be written.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad`↵
`IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.15 writeSingleCoil()

```
virtual Modbus::StatusCode ModbusInterface::writeSingleCoil (
    uint8_t unit,
    uint16_t offset,
    bool value) [virtual]
```

Function for write one separate discrete output (0x coil).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>value</i>	Boolean value to be set.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad` ← `IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.9.2.16 writeSingleRegister()

```
virtual Modbus::StatusCode ModbusInterface::writeSingleRegister (
    uint8_t unit,
    uint16_t offset,
    uint16_t value) [virtual]
```

Function for write one separate 16-bit holding register (4x).

Parameters

in	<i>unit</i>	Address of the remote Modbus device.
in	<i>offset</i>	Starting offset (0-based).
in	<i>value</i>	16-bit unsigned integer value to be set.

Returns

The result [Modbus::StatusCode](#) of the operation. Default implementation returns `Status_Bad` ← `IllegalFunction`.

Reimplemented in [ModbusClientPort](#).

7.10.1 Detailed Description

The [ModbusObject](#) class is the base class for objects that use signal/slot mechanism.

[ModbusObject](#) is designed to be a base class for objects that need to use simplified Qt-like signal/slot mechanism. User can connect signal of the object he want to listen to his own function or method of his own class and then it can be disconnected if he is not interesting of this signal anymore. Callbacks will be called in order which it were connected.

[ModbusObject](#) has a map which key means signal identifier (pointer to signal) and value is a list of callbacks functions/methods connected to this signal.

[ModbusObject](#) has [objectName](#) () and [setObjectName](#) methods. This methods can be used to simply identify object which is signal's source (e.g. to print info in console).

Note

[ModbusObject](#) class is not thread safe

7.10.2 Constructor & Destructor Documentation

7.10.2.1 ModbusObject()

```
ModbusObject::ModbusObject ()
```

Constructor of the class.

7.10.2.2 ~ModbusObject()

```
virtual ModbusObject::~~ModbusObject () [virtual]
```

Virtual destructor of the class.

7.10.3 Member Function Documentation

7.10.3.1 connect() [1/2]

```
template<class SignalClass , class ReturnType , class ... Args>
void ModbusObject::connect (
    ModbusMethodPointer< SignalClass, ReturnType, Args ... > signalMethodPtr,
    ModbusFunctionPointer< ReturnType, Args ... > funcPtr) [inline]
```

Same as `ModbusObject::connect (ModbusMethodPointer, T*, ModbusMethodPointer)` but connects `ModbusFunctionPointer` to current object's signal `signalMethodPtr`.

7.10.3.2 connect() [2/2]

```
template<class SignalClass , class T , class ReturnType , class ... Args>
void ModbusObject::connect (
    ModbusMethodPointer< SignalClass, ReturnType, Args ... > signalMethodPtr,
    T * object,
    ModbusMethodPointer< T, ReturnType, Args ... > objectMethodPtr) [inline]
```

Connect this object's signal `signalMethodPtr` to the objects method `objectMethodPtr`.

```
class MyClass : public ModbusObject { public: void signalSomething(int a, int b) {
    emitSignal(&MyClass::signalSomething, a, b); } };
class MyReceiver { public: void slotSomething(int a, int b) { doSomething(); } };
MyClass c;
MyReceiver r;
c.connect(&MyClass::signalSomething, r, &MyReceiver::slotSomething);
```

Note

`SignalClass` template type refers to any class but it must be this or derived class. It makes separate `SignalClass` to easly refers signal of the derived class.

7.10.3.3 disconnect() [1/3]

```
template<class ReturnType , class ... Args>
void ModbusObject::disconnect (
    ModbusFunctionPointer< ReturnType, Args ... > funcPtr) [inline]
```

Disconnects function `funcPtr` from all signals of current object.

7.10.3.4 disconnect() [2/3]

```
template<class T >
void ModbusObject::disconnect (
    T * object) [inline]
```

Disconnect all slots of T **object* from all signals of current object.

7.10.3.5 disconnect() [3/3]

```
template<class T , class ReturnType , class ... Args>
void ModbusObject::disconnect (
    T * object,
    ModbusMethodPointer< T, ReturnType, Args ... > objectMethodPtr) [inline]
```

Disconnects slot represented by pair (*object*, *objectMethodPtr*) from all signals of current object.

7.10.3.6 disconnectFunc()

```
void ModbusObject::disconnectFunc (
    void * funcPtr) [inline]
```

Disconnects function *funcPtr* from all signals of current object, but *funcPtr* is a void pointer.

7.10.3.7 emitSignal()

```
template<class T , class ... Args>
void ModbusObject::emitSignal (
    const char * thisMethodId,
    ModbusMethodPointer< T, void, Args ... > thisMethod,
    Args ... args) [inline], [protected]
```

Template method for emit signal. Must be called from within of the signal method.

7.10.3.8 objectName()

```
const Modbus::Char * ModbusObject::objectName () const
```

Returns a pointer to current object's name string.

7.10.3.9 sender()

```
static ModbusObject * ModbusObject::sender () [static]
```

Returns a pointer to the object that sent the signal. This pointer is valid in thread where signal was occurred only. So this function must be called only within the slot that is a callback of signal occurred.

7.10.3.10 setObjectName()

```
void ModbusObject::setObjectName (
    const Modbus::Char * name)
```

Set name of current object.

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusObject.h

7.11 ModbusPort Class Reference

The abstract class `ModbusPort` is the base class for a specific implementation of the `Modbus` communication protocol.

```
#include <ModbusPort.h>
```

7.11.1 Detailed Description

The abstract class [ModbusPort](#) is the base class for a specific implementation of the [Modbus](#) communication protocol.

[ModbusPort](#) contains general functions for working with a specific port, implementing a specific version of the [Modbus](#) communication protocol. For example, versions for working with a TCP port or a serial port.

7.11.2 Constructor & Destructor Documentation

7.11.2.1 `~ModbusPort()`

```
virtual ModbusPort::~~ModbusPort () [virtual]
```

Virtual destructor.

7.11.3 Member Function Documentation

7.11.3.1 `close()`

```
virtual Modbus::StatusCode ModbusPort::close () [pure virtual]
```

Closes the port (breaks the connection) and returns the status the result status.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

7.11.3.2 `handle()`

```
virtual Modbus::Handle ModbusPort::handle () const [pure virtual]
```

Returns the native handle value that depenp on OS used. For TCP it socket handle, for serial port - file handle.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

7.11.3.3 `isBlocking()`

```
bool ModbusPort::isBlocking () const
```

Returns `true` if the port works in synch (blocking) mode, `false` otherwise.

7.11.3.4 isChanged()

```
bool ModbusPort::isChanged () const
```

Returns `true` if the port settings have been changed and the port needs to be reopened/reestablished communication with the remote device, `false` otherwise.

7.11.3.5 isNonBlocking()

```
bool ModbusPort::isNonBlocking () const
```

Returns `true` if the port works in asynch (nonblocking) mode, `false` otherwise.

7.11.3.6 isOpen()

```
virtual bool ModbusPort::isOpen () const [pure virtual]
```

Returns `true` if the port is open/communication with the remote device is established, `false` otherwise.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

7.11.3.7 isServerMode()

```
bool ModbusPort::isServerMode () const
```

Returns `true` if the port works in server mode, `false` otherwise.

7.11.3.8 lastErrorStatus()

```
Modbus::StatusCode ModbusPort::lastErrorStatus () const
```

Returns the status of the last error of the performed operation.

7.11.3.9 lastErrorText()

```
const Modbus::Char * ModbusPort::lastErrorText () const
```

Returns the pointer to `const Char` text buffer of the last error of the performed operation.

7.11.3.10 open()

```
virtual Modbus::StatusCode ModbusPort::open () [pure virtual]
```

Opens port (create connection) for further operations and returns the result status.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

7.11.3.11 read()

```
virtual Modbus::StatusCode ModbusPort::read () [pure virtual]
```

Implements the algorithm for reading from the port and returns the status of the operation.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

7.11.3.12 readBuffer()

```
virtual Modbus::StatusCode ModbusPort::readBuffer (
    uint8_t & unit,
    uint8_t & func,
    uint8_t * buff,
    uint16_t maxSzBuff,
    uint16_t * szOutBuff) [pure virtual]
```

The function parses the packet that the [read\(\)](#) function puts into the buffer, checks it for correctness, extracts its parameters, and returns the status of the operation.

Implemented in [ModbusAscPort](#), [ModbusRtuPort](#), and [ModbusTcpPort](#).

7.11.3.13 readBufferData()

```
virtual const uint8_t * ModbusPort::readBufferData () const [pure virtual]
```

Returns pointer to data of read buffer.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

7.11.3.14 readBufferSize()

```
virtual uint16_t ModbusPort::readBufferSize () const [pure virtual]
```

Returns size of data of read buffer.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

7.11.3.15 setError()

```
Modbus::StatusCode ModbusPort::setError (
    Modbus::StatusCode status,
    const Modbus::Char * text) [protected]
```

Sets the error parameters of the last operation performed.

7.11.3.16 setNextRequestRepeated()

```
virtual void ModbusPort::setNextRequestRepeated (
    bool v) [virtual]
```

For the TCP version of the [Modbus](#) protocol. The identifier of each subsequent parcel is automatically increased by 1. If you set `setNextRequestRepeated(true)` then the next ID will not be increased by 1 but for only one next parcel.

Reimplemented in [ModbusTcpPort](#).

7.11.3.17 setServerMode()

```
virtual void ModbusPort::setServerMode (
    bool mode) [virtual]
```

Sets server mode if `true`, `false` for client mode.

7.11.3.18 setTimeout()

```
void ModbusPort::setTimeout (
    uint32_t timeout)
```

Sets the setting for the connection timeout of the remote device.

7.11.3.19 timeout()

```
uint32_t ModbusPort::timeout () const
```

Returns the setting for the connection timeout of the remote device.

7.11.3.20 type()

```
virtual Modbus::ProtocolType ModbusPort::type () const [pure virtual]
```

Returns the [Modbus](#) protocol type.

Implemented in [ModbusAscPort](#), [ModbusRtuPort](#), and [ModbusTcpPort](#).

7.11.3.21 write()

```
virtual Modbus::StatusCode ModbusPort::write () [pure virtual]
```

Implements the algorithm for writing to the port and returns the status of the operation.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

7.11.3.22 writeBuffer()

```
virtual Modbus::StatusCode ModbusPort::writeBuffer (
    uint8_t unit,
    uint8_t func,
    uint8_t * buff,
    uint16_t szInBuff) [pure virtual]
```

The function directly generates a packet and places it in the buffer for further sending. Returns the status of the operation.

Implemented in [ModbusAscPort](#), [ModbusRtuPort](#), and [ModbusTcpPort](#).

7.11.3.23 writeBufferData()

```
virtual const uint8_t * ModbusPort::writeBufferData () const [pure virtual]
```

Returns pointer to data of write buffer.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

7.11.3.24 writeBufferSize()

```
virtual uint16_t ModbusPort::writeBufferSize () const [pure virtual]
```

Returns size of data of write buffer.

Implemented in [ModbusSerialPort](#), and [ModbusTcpPort](#).

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusPort.h](#)

7.12 ModbusRtuPort Class Reference

Implements RTU version of the [Modbus](#) communication protocol.

```
#include <ModbusRtuPort.h>
```

7.12.1 Detailed Description

Implements RTU version of the [Modbus](#) communication protocol.

[ModbusRtuPort](#) derived from [ModbusSerialPort](#) and implements `writeBuffer` and `readBuffer` for RTU version of [Modbus](#) communication protocol.

7.12.2 Constructor & Destructor Documentation

7.12.2.1 [ModbusRtuPort](#)()

```
ModbusRtuPort::ModbusRtuPort (
    bool blocking = false)
```

Constructor of the class. if `blocking = true` then defines blocking mode, non blocking otherwise.

7.12.2.2 [~ModbusRtuPort](#)()

```
ModbusRtuPort::~~ModbusRtuPort ()
```

Destructor of the class.

7.12.3 Member Function Documentation

7.12.3.1 [readBuffer](#)()

```
Modbus::StatusCode ModbusRtuPort::readBuffer (
    uint8_t & unit,
    uint8_t & func,
    uint8_t * buff,
    uint16_t maxSzBuff,
    uint16_t * szOutBuff) [override], [protected], [virtual]
```

The function parses the packet that the `read()` function puts into the buffer, checks it for correctness, extracts its parameters, and returns the status of the operation.

Implements [ModbusPort](#).

7.12.3.2 type()

```
Modbus::ProtocolType ModbusRtuPort::type () const [inline], [override], [virtual]
```

Returns the [Modbus](#) protocol type. For [ModbusAscPort](#) returns [Modbus::RTU](#).

Implements [ModbusPort](#).

7.12.3.3 writeBuffer()

```
Modbus::StatusCode ModbusRtuPort::writeBuffer (
    uint8_t unit,
    uint8_t func,
    uint8_t * buff,
    uint16_t szInBuff) [override], [protected], [virtual]
```

The function directly generates a packet and places it in the buffer for further sending. Returns the status of the operation.

Implements [ModbusPort](#).

The documentation for this class was generated from the following file:

7.13.1 Detailed Description

The abstract class [ModbusSerialPort](#) is the base class serial port [Modbus](#) communications.

The abstract class [ModbusSerialPort](#) is the base class for a specific implementation of the [Modbus](#) communication protocol that using Serial Port. It implements functions which are common for the serial port: `open`, `close`, `read` and `write`.

7.13.2 Constructor & Destructor Documentation

7.13.2.1 `~ModbusSerialPort()`

```
ModbusSerialPort::~~ModbusSerialPort ()
```

Virtual destructor. Closes serial port before destruction.

7.13.3 Member Function Documentation

7.13.3.1 `baudRate()`

```
int32_t ModbusSerialPort::baudRate () const
```

Returns current serial port baud rate, e.g. 1200, 2400, 9600, 115200 etc.

7.13.3.2 `close()`

```
Modbus::StatusCode ModbusSerialPort::close () [override], [virtual]
```

Close serial port and returns [Modbus::Status_Good](#).

Implements [ModbusPort](#).

7.13.3.3 `dataBits()`

```
int8_t ModbusSerialPort::dataBits () const
```

Returns current serial port data bits, e.g. 5, 6, 7 or 8.

7.13.3.4 `flowControl()`

```
Modbus::FlowControl ModbusSerialPort::flowControl () const
```

Returns current serial port [Modbus::FlowControl](#) enum value.

7.13.3.5 handle()

```
Modbus::Handle ModbusSerialPort::handle () const [override], [virtual]
```

Returns native OS serial port handle, e.g. HANDLE value for Windows.

Implements [ModbusPort](#).

7.13.3.6 isOpen()

```
bool ModbusSerialPort::isOpen () const [override], [virtual]
```

Returns `true` if the serial port is open, `false` otherwise.

Implements [ModbusPort](#).

7.13.3.7 open()

```
Modbus::StatusCode ModbusSerialPort::open () [override], [virtual]
```

Try to open serial port and returns [Modbus::Status_Good](#) if success or [Modbus::Status_BadSerialOpen](#) otherwise.

Implements [ModbusPort](#).

7.13.3.8 parity()

```
Modbus::Parity ModbusSerialPort::parity () const
```

Returns current serial port [Modbus::Parity](#) enum value.

7.13.3.9 portName()

```
const Modbus::Char * ModbusSerialPort::portName () const
```

Returns current serial port name, e.g. COM1 for Windows or /dev/ttyS0 for Unix.

7.13.3.10 read()

```
Modbus::StatusCode ModbusSerialPort::read () [override], [protected], [virtual]
```

Implements the algorithm for reading from the port and returns the status of the operation.

Implements [ModbusPort](#).

7.13.3.11 readBufferData()

```
const uint8_t * ModbusSerialPort::readBufferData () const [override], [virtual]
```

Returns pointer to data of read buffer.

Implements [ModbusPort](#).

7.13.3.12 readBufferSize()

```
uint16_t ModbusSerialPort::readBufferSize () const [override], [virtual]
```

Returns size of data of read buffer.

Implements [ModbusPort](#).

7.13.3.13 setBaudRate()

```
void ModbusSerialPort::setBaudRate (  
    int32_t baudRate)
```

Set current serial port baud rate.

7.13.3.14 setDataBits()

```
void ModbusSerialPort::setDataBits (  
    int8_t dataBits)
```

Set current serial port baud data bits.

7.13.3.15 setFlowControl()

```
void ModbusSerialPort::setFlowControl (  
    Modbus::FlowControl flowControl)
```

Set current serial port [Modbus::FlowControl](#) enum value.

7.13.3.16 setParity()

```
void ModbusSerialPort::setParity (  
    Modbus::Parity parity)
```

Set current serial port [Modbus::Parity](#) enum value.

7.13.3.17 setPortName()

```
void ModbusSerialPort::setPortName (  
    const Modbus::Char * portName)
```

Set current serial port name.

7.13.3.18 setStopBits()

```
void ModbusSerialPort::setStopBits (
    Modbus::StopBits stopBits)
```

Set current serial port `Modbus::StopBits` enum value.

7.13.3.19 setTimeoutFirstByte()

```
void ModbusSerialPort::setTimeoutFirstByte (
    uint32_t timeout) [inline]
```

Set current serial port timeout of waiting first byte of incoming packet (in milliseconds).

7.13.3.20 setTimeoutInterByte()

```
void ModbusSerialPort::setTimeoutInterByte (
    uint32_t timeout)
```

Set current serial port timeout of waiting next byte (inter byte waiting timeout) of incoming packet (in milliseconds).

7.13.3.21 stopBits()

```
Modbus::StopBits ModbusSerialPort::stopBits () const
```

Returns current serial port `Modbus::StopBits` enum value.

7.13.3.22 timeoutFirstByte()

```
uint32_t ModbusSerialPort::timeoutFirstByte () const [inline]
```

Returns current serial port timeout of waiting first byte of incoming packet (in milliseconds).

7.13.3.23 timeoutInterByte()

```
uint32_t ModbusSerialPort::timeoutInterByte () const
```

Returns current serial port timeout of waiting next byte (inter byte waiting timeout) of incoming packet (in milliseconds).

7.13.3.24 write()

```
Modbus::StatusCode ModbusSerialPort::write () [override], [protected], [virtual]
```

Implements the algorithm for writing to the port and returns the status of the operation.

Implements `ModbusPort`.

7.13.3.25 writeBufferData()

```
const uint8_t * ModbusSerialPort::writeBufferData () const [override], [virtual]
```

Returns pointer to data of write buffer.

Implements [ModbusPort](#).

7.13.3.26 writeBufferSize()

```
uint16_t ModbusSerialPort::writeBufferSize () const [override], [virtual]
```

Returns size of data of write buffer.

Implements [ModbusPort](#).

The documentation for this class was generated from the following file:

7.14.1 Detailed Description

Abstract base class for direct control of [ModbusPort](#) derived classes (TCP or serial) for server side.

Pointer to [ModbusPort](#) object must be passed to [ModbusServerPort](#) derived class constructor.

Also assumed that [ModbusServerPort](#) derived classes must accept [ModbusInterface](#) object in its constructor to process every [Modbus](#) function request.

7.14.2 Member Function Documentation

7.14.2.1 [close\(\)](#)

```
virtual Modbus::StatusCode ModbusServerPort::close () [pure virtual]
```

Closes port/connection and returns status of the operation.

Implemented in [ModbusServerResource](#), and [ModbusTcpServer](#).

7.14.2.2 context()

```
void * ModbusServerPort::context () const
```

Return context of the port previously set by `setContext` function or `nullptr` by default.

7.14.2.3 device()

```
ModbusInterface * ModbusServerPort::device () const
```

Returns pointer to [ModbusInterface](#) object/device that was previously passed in constructor. This device must process every input [Modbus](#) function request for this server port.

7.14.2.4 isBroadcastEnabled()

```
bool ModbusServerPort::isBroadcastEnabled () const
```

Returns `true` if broadcast mode for 0 unit address is enabled, `false` otherwise. Broadcast mode for 0 unit address is required by [Modbus](#) protocol so it is enabled by default

7.14.2.5 isOpen()

```
virtual bool ModbusServerPort::isOpen () const [pure virtual]
```

Returns `true` if inner port is open, `false` otherwise.

Implemented in [ModbusServerResource](#), and [ModbusTcpServer](#).

7.14.2.6 isStateClosed()

```
bool ModbusServerPort::isStateClosed () const
```

Returns `true` if current port has closed inner state, `false` otherwise.

7.14.2.7 isTcpServer()

```
virtual bool ModbusServerPort::isTcpServer () const [virtual]
```

Returns `true` if current server port is TCP server, `false` otherwise.

Reimplemented in [ModbusTcpServer](#).

7.14.2.8 ModbusObject()

```
ModbusObject::ModbusObject () [protected]
```

Constructor of the class.

7.14.2.9 open()

```
virtual Modbus::StatusCode ModbusServerPort::open () [pure virtual]
```

Open inner port/connection to begin working and returns status of the operation. User do not need to call this method directly.

Implemented in [ModbusServerResource](#), and [ModbusTcpServer](#).

7.14.2.10 process()

```
virtual Modbus::StatusCode ModbusServerPort::process () [pure virtual]
```

Main function of the class. Must be called in the cycle. Return status code is not very useful but can indicate that inner server operations are good, bad or in process.

Implemented in [ModbusServerResource](#), and [ModbusTcpServer](#).

7.14.2.11 setBroadcastEnabled()

```
virtual void ModbusServerPort::setBroadcastEnabled (
    bool enable) [virtual]
```

Enables broadcast mode for 0 unit address. It is enabled by default.

See also

[isBroadcastEnabled\(\)](#)

Reimplemented in [ModbusTcpServer](#).

7.14.2.12 setContext()

```
void ModbusServerPort::setContext (
    void * context)
```

Set context of the port.

7.14.2.13 setDevice()

```
void ModbusServerPort::setDevice (
    ModbusInterface * device)
```

Set pointer to [ModbusInterface](#) object/device to transfer all request of it. This device must process every input [Modbus](#) function request for this server port.

7.14.2.14 setUnitMap()

```
virtual void ModbusServerPort::setUnitMap (
    const void * unitmap) [virtual]
```

Set units map of current server. Server make a copy of units map data.

See also

[unitMap\(\)](#)

Reimplemented in [ModbusTcpServer](#).

7.14.2.15 signalClosed()

```
void ModbusServerPort::signalClosed (
    const Modbus::Char * source)
```

Signal occurred when inner port was closed. *source* - current port name.

7.14.2.16 signalError()

```
void ModbusServerPort::signalError (
    const Modbus::Char * source,
    Modbus::StatusCode status,
    const Modbus::Char * text)
```

Signal occurred when error is occurred with error's *status* and *text*. *source* - current port name.

7.14.2.17 signalOpened()

```
void ModbusServerPort::signalOpened (
    const Modbus::Char * source)
```

Signal occurred when inner port was opened. *source* - current port name.

7.14.2.18 signalRx()

```
void ModbusServerPort::signalRx (
    const Modbus::Char * source,
    const uint8_t * buff,
    uint16_t size)
```

Signal occurred when the incoming packet 'Rx' from the internal list of callbacks, passing them the input array 'buff' and its size 'size'. *source* - current port name.

7.14.2.19 signalTx()

```
void ModbusServerPort::signalTx (
    const Modbus::Char * source,
    const uint8_t * buff,
    uint16_t size)
```

Signal occurred when the original packet 'Tx' from the internal list of callbacks, passing them the original array 'buff' and its size 'size'. *source* - current port name.

7.14.2.20 type()

```
virtual Modbus::ProtocolType ModbusServerPort::type () const [pure virtual]
```

Returns type of [Modbus](#) protocol.

Implemented in [ModbusServerResource](#), and [ModbusTcpServer](#).

7.14.2.21 unitMap()

```
const void * ModbusServerPort::unitMap () const
```

Return pointer to the units map byte array of the current server. By default unit map is not set so return value is `nullptr`. Unit map is data type with size of 32 bytes in which every bit represents unit address from 0 to 255. So bit 0 of byte 0 represents unit address 0, bit 1 of byte 0 represents unit address 1 and so on. Bit 0 of byte 1 represents unit address 8, bit 7 of byte 31 represents unit address 255. If set unit map can enable or disable (depends on respecting 1/0 bit value) unit address for further processing. It is not set by default and function returns `nullptr`.

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusServerPort.h

7.15 ModbusServerResource Class Reference

7.15.1 Detailed Description

Implements direct control for [ModbusPort](#) derived classes (TCP or serial) for server side.

[ModbusServerResource](#) derived from [ModbusServerPort](#) and makes [ModbusPort](#) object behaves like server port. Pointer to [ModbusPort](#) object is passed to [ModbusServerResource](#) constructor.

Also [ModbusServerResource](#) have [ModbusInterface](#) object as second parameter of constructor which process every [Modbus](#) function request.

7.15.2 Constructor & Destructor Documentation

7.15.2.1 [ModbusServerResource](#)()

```
ModbusServerResource::ModbusServerResource (
    ModbusPort * port,
    ModbusInterface * device)
```

Constructor of the class.

Parameters

in	<i>port</i>	Pointer to the ModbusPort which is managed by the current class object.
in	<i>device</i>	Pointer to the ModbusInterface implementation to which all requests for Modbus functions are forwarded.

7.15.3 Member Function Documentation

7.15.3.1 [close](#)()

```
Modbus::StatusCode ModbusServerResource::close () [override], [virtual]
```

Closes port/connection and returns status of the operation.

Implements [ModbusServerPort](#).

7.15.3.2 isOpen()

```
bool ModbusServerResource::isOpen () const [override], [virtual]
```

Returns `true` if inner port is open, `false` otherwise.

Implements [ModbusServerPort](#).

7.15.3.3 open()

```
Modbus::StatusCode ModbusServerResource::open () [override], [virtual]
```

Open inner port/connection to begin working and returns status of the operation. User do not need to call this method directly.

Implements [ModbusServerPort](#).

7.15.3.4 port()

```
ModbusPort * ModbusServerResource::port () const
```

Returns pointer to inner port which was previously passed in constructor.

7.15.3.5 process()

```
Modbus::StatusCode ModbusServerResource::process () [override], [virtual]
```

Main function of the class. Must be called in the cycle. Return status code is not very useful but can indicate that inner server operations are good, bad or in process.

Implements [ModbusServerPort](#).

7.15.3.6 processDevice()

```
virtual Modbus::StatusCode ModbusServerResource::processDevice () [protected], [virtual]
```

Transfer input request [Modbus](#) function to inner device and returns status of the operation.

7.15.3.7 processInputData()

```
virtual Modbus::StatusCode ModbusServerResource::processInputData (  
    const uint8_t * buff,  
    uint16_t sz) [protected], [virtual]
```

Process input data `buff` with `size` and returns status of the operation.

7.15.3.8 processOutputData()

```
virtual Modbus::StatusCode ModbusServerResource::processOutputData (
    uint8_t * buff,
    uint16_t & sz) [protected], [virtual]
```

Process output data `buff` with `size` and returns status of the operation.

7.15.3.9 type()

```
Modbus::ProtocolType ModbusServerResource::type () const [override], [virtual]
```

Returns type of `Modbus` protocol. Same as `port () -> type ()`.

Implements `ModbusServerPort`.

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusServerResource.h](#)

```

Virtual destructor of the class

7.16.3 Member Function Documentation

7.16.3.1 exec()

```
template<class ReturnType , class ... Args>
virtual ReturnType ModbusSlotBase< ReturnType, Args >::exec (
    Args ... args) [pure virtual]
```

Execute method or function slot

Implemented in [ModbusSlotFunction< ReturnType, Args >](#), and [ModbusSlotMethod< T, ReturnType, Args >](#).

7.16.3.2 methodOrFunction()

```
template<class ReturnType , class ... Args>
virtual void * ModbusSlotBase< ReturnType, Args >::methodOrFunction () const [pure virtual]
```

Return pointer to method (in case of method slot) or function (in case of function slot)

Implemented in [ModbusSlotFunction< ReturnType, Args >](#), and [ModbusSlotMethod< T, ReturnType, Args >](#).

7.16.3.3 object()

```
template<class ReturnType , class ... Args>
virtual void * ModbusSlotBase< ReturnType, Args >::object () const [inline], [virtual]
```

Return pointer to object which method belongs to (in case of method slot) or nullptr in case of function slot

Reimplemented in [ModbusSlotMethod< T, ReturnType, Args >](#).

The documentation for this class was generated from the following file:

7.18.1 Detailed Description

```
template<class T, class ReturnType, class ... Args>
class ModbusSlotMethod< T, ReturnType, Args >
```

[ModbusSlotMethod](#) template class hold pointer to object and its method

7.18.2 Constructor & Destructor Documentation

7.18.2.1 ModbusSlotMethod()

```
template<class T , class ReturnType , class ... Args>
ModbusSlotMethod< T, ReturnType, Args >::ModbusSlotMethod (
    T * object,
    ModbusMethodPointer< T, ReturnType, Args... > methodPtr) [inline]
```

Constructor of the slot.

Parameters

in	<i>object</i>	Pointer to object.
in	<i>methodPtr</i>	Pointer to object's method.

7.18.3 Member Function Documentation

7.18.3.1 exec()

```
template<class T , class ReturnType , class ... Args>
ReturnType ModbusSlotMethod< T, ReturnType, Args >::exec (
    Args ... args) [inline], [override], [virtual]
```

Execute method or function slot

Implements [ModbusSlotBase< ReturnType, Args ... >](#).

7.18.3.2 methodOrFunction()

```
template<class T , class ReturnType , class ... Args>
void * ModbusSlotMethod< T, ReturnType, Args >::methodOrFunction () const [inline], [override], [virtual]
```

Return pointer to method (in case of method slot) or function (in case of function slot)

Implements [ModbusSlotBase< ReturnType, Args ... >](#).

7.18.3.3 object()

```
template<class T , class ReturnType , class ... Args>
void * ModbusSlotMethod< T, ReturnType, Args >::object () const [inline], [override], [virtual]
```

Return pointer to object which method belongs to (in case of method slot) or `nullptr` in case of function slot

Reimplemented from [ModbusSlotBase< ReturnType, Args ... >](#).

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusObject.h](#)

7.19 ModbusTcpPort Class Reference

Class [ModbusTcpPort](#) implements TCP version of [Modbus](#) protocol.

```
#include <ModbusTcpPort.h>
```

Inheritance diagram for [ModbusTcpPort](#):

7.19.1 Detailed Description

Class [ModbusTcpPort](#) implements TCP version of [Modbus](#) protocol.

[ModbusPort](#) contains function to work with TCP-port (connection).

7.19.2 Constructor & Destructor Documentation

7.19.2.1 ModbusTcpPort() [1/2]

```
ModbusTcpPort::ModbusTcpPort (
    ModbusTcpSocket * socket,
    bool blocking = false)
```

Constructor of the class.

7.19.2.2 ModbusTcpPort() [2/2]

```
ModbusTcpPort::ModbusTcpPort (
    bool blocking = false)
```

Constructor of the class.

7.19.2.3 ~ModbusTcpPort()

```
ModbusTcpPort::~~ModbusTcpPort ()
```

Destructor of the class. Close socket if it was not closed previously

7.19.3 Member Function Documentation

7.19.3.1 autoIncrement()

```
bool ModbusTcpPort::autoIncrement () const
```

Returns 'true' if the identifier of each subsequent parcel is automatically incremented by 1, 'false' otherwise.

7.19.3.2 close()

```
Modbus::StatusCode ModbusTcpPort::close () [override], [virtual]
```

Closes the port (breaks the connection) and returns the status the result status.

Implements [ModbusPort](#).

7.19.3.3 handle()

```
Modbus::Handle ModbusTcpPort::handle () const [override], [virtual]
```

Native OS handle for the socket.

Implements [ModbusPort](#).

7.19.3.4 host()

```
const Modbus::Char * ModbusTcpPort::host () const
```

Returns the settings for the IP address or DNS name of the remote device.

7.19.3.5 isOpen()

```
bool ModbusTcpPort::isOpen () const [override], [virtual]
```

Returns `true` if the port is open/communication with the remote device is established, `false` otherwise.

Implements [ModbusPort](#).

7.19.3.6 open()

```
Modbus::StatusCode ModbusTcpPort::open () [override], [virtual]
```

Opens port (create connection) for further operations and returns the result status.

Implements [ModbusPort](#).

7.19.3.7 port()

```
uint16_t ModbusTcpPort::port () const
```

Returns the setting for the TCP port number of the remote device.

7.19.3.8 read()

```
Modbus::StatusCode ModbusTcpPort::read () [override], [protected], [virtual]
```

Implements the algorithm for reading from the port and returns the status of the operation.

Implements [ModbusPort](#).

7.19.3.9 readBuffer()

```
Modbus::StatusCode ModbusTcpPort::readBuffer (
    uint8_t & unit,
    uint8_t & func,
    uint8_t * buff,
    uint16_t maxSzBuff,
    uint16_t * szOutBuff) [override], [protected], [virtual]
```

The function parses the packet that the [read\(\)](#) function puts into the buffer, checks it for correctness, extracts its parameters, and returns the status of the operation.

Implements [ModbusPort](#).

7.19.3.10 readBufferData()

```
const uint8_t * ModbusTcpPort::readBufferData () const [override], [virtual]
```

Returns pointer to data of read buffer.

Implements [ModbusPort](#).

7.19.3.11 readBufferSize()

```
uint16_t ModbusTcpPort::readBufferSize () const [override], [virtual]
```

Returns size of data of read buffer.

Implements [ModbusPort](#).

7.19.3.12 setHost()

```
void ModbusTcpPort::setHost (
    const Modbus::Char * host)
```

Sets the settings for the IP address or DNS name of the remote device.

7.19.3.13 setNextRequestRepeated()

```
void ModbusTcpPort::setNextRequestRepeated (
    bool v) [override], [virtual]
```

Repeat next request parameters (for [Modbus](#) TCP transaction Id).

Reimplemented from [ModbusPort](#).

7.19.3.14 setPort()

```
void ModbusTcpPort::setPort (
    uint16_t port)
```

Sets the settings for the TCP port number of the remote device.

7.19.3.15 type()

```
Modbus::ProtocolType ModbusTcpPort::type () const [inline], [override], [virtual]
```

Returns the [Modbus](#) protocol type. In this case it is `Modbus::TCP`.

Implements [ModbusPort](#).

7.19.3.16 write()

```
Modbus::StatusCode ModbusTcpPort::write () [override], [protected], [virtual]
```

Implements the algorithm for writing to the port and returns the status of the operation.

Implements [ModbusPort](#).

7.19.3.17 writeBuffer()

```
Modbus::StatusCode ModbusTcpPort::writeBuffer (
    uint8_t unit,
    uint8_t func,
    uint8_t * buff,
    uint16_t szInBuff) [override], [protected], [virtual]
```

The function directly generates a packet and places it in the buffer for further sending. Returns the status of the operation.

Implements [ModbusPort](#).

7.19.3.18 writeBufferData()

```
const uint8_t * ModbusTcpPort::writeBufferData () const [override], [virtual]
```

Returns pointer to data of write buffer.

Implements [ModbusPort](#).

7.19.3.19 writeBufferSize()

```
uint16_t ModbusTcpPort::writeBufferSize () const [override], [virtual]
```

Returns size of data of write buffer.

Implements [ModbusPort](#).

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusTcpPort.h](#)

7.20 ModbusTcpServer Class Reference

The [ModbusTcpServer](#) class implements TCP server part of the [Modbus](#) protocol.

```
#include <ModbusTcpServer.h>
```

Inheritance diagram for ModbusTcpServer:

7.20.1 Detailed Description

The [ModbusTcpServer](#) class implements TCP server part of the [Modbus](#) protocol.

[ModbusTcpServer](#) ...

7.20.2 Constructor & Destructor Documentation

7.20.2.1 [ModbusTcpServer\(\)](#)

```
ModbusTcpServer::ModbusTcpServer (
    ModbusInterface * device)
```

Constructor of the class. `device` param is object which might process incoming requests for read/write memory.

7.20.2.2 [~ModbusTcpServer\(\)](#)

```
ModbusTcpServer::~~ModbusTcpServer ()
```

Destructor of the class. Clear all unclosed connections.

7.20.3 Member Function Documentation

7.20.3.1 [clearConnections\(\)](#)

```
void ModbusTcpServer::clearConnections () [protected]
```

Clear all allocated memory for previously established connections.

7.20.3.2 [close\(\)](#)

```
Modbus::StatusCode ModbusTcpServer::close () [override], [virtual]
```

Stop listening for incoming connections and close all previously opened connections.

Returns

- [Modbus::Status_Good](#) on success
- [Modbus::Status_Processing](#) when operation is not complete

Implements [ModbusServerPort](#).

7.20.3.3 createTcpPort()

```
virtual ModbusServerPort * ModbusTcpServer::createTcpPort (  
    ModbusTcpSocket * socket) [virtual]
```

Creates [ModbusServerPort](#) for new incoming connection defined by [ModbusTcpSocket](#) pointer May be reimplemented in subclasses.

7.20.3.4 deleteTcpPort()

```
virtual void ModbusTcpServer::deleteTcpPort (  
    ModbusServerPort * port) [virtual]
```

Deletes [ModbusServerPort](#) by default. May be reimplemented in subclasses.

7.20.3.5 isOpen()

```
bool ModbusTcpServer::isOpen () const [override], [virtual]
```

Returns `true` if the server is currently listening for incoming connections, `false` otherwise.

Implements [ModbusServerPort](#).

7.20.3.6 isTcpServer()

```
bool ModbusTcpServer::isTcpServer () const [inline], [override], [virtual]
```

Returns `true`.

Reimplemented from [ModbusServerPort](#).

7.20.3.7 maxConnections()

```
uint32_t ModbusTcpServer::maxConnections () const
```

Returns setting for the maximum number of simultaneous connections to the server.

7.20.3.8 nextPendingConnection()

```
ModbusTcpSocket * ModbusTcpServer::nextPendingConnection () [protected]
```

Checks for incoming connections and returns pointer [ModbusTcpSocket](#) if new connection established, `nullptr` otherwise.

7.20.3.9 open()

```
Modbus::StatusCode ModbusTcpServer::open () [override], [virtual]
```

Try to listen for incoming connections on TCP port that was previously set ([port\(\)](#)).

Returns

- [Modbus::Status_Good](#) on success
- [Modbus::Status_Processing](#) when operation is not complete
- [Modbus::Status_BadTcpCreate](#) when can't create TCP socket
- [Modbus::Status_BadTcpBind](#) when can't bind TCP socket
- [Modbus::Status_BadTcpListen](#) when can't listen TCP socket

Implements [ModbusServerPort](#).

7.20.3.10 port()

```
uint16_t ModbusTcpServer::port () const
```

Returns the setting for the TCP port number of the server.

7.20.3.11 process()

```
Modbus::StatusCode ModbusTcpServer::process () [override], [virtual]
```

Main function of TCP server. Must be called in cycle to perform all incoming TCP connections.

Implements [ModbusServerPort](#).

7.20.3.12 setBroadcastEnabled()

```
void ModbusTcpServer::setBroadcastEnabled (  
    bool enable) [override], [virtual]
```

Enables broadcast mode for 0 unit address. It is enabled by default.

See also

[isBroadcastEnabled\(\)](#)

Reimplemented from [ModbusServerPort](#).

7.20.3.13 setMaxConnections()

```
void ModbusTcpServer::setMaxConnections (  
    uint32_t maxconn)
```

Sets the setting for the maximum number of simultaneous connections to the server.

7.20.3.14 setPort()

```
void ModbusTcpServer::setPort (
    uint16_t port)
```

Sets the settings for the TCP port number of the server.

7.20.3.15 setTimeout()

```
void ModbusTcpServer::setTimeout (
    uint32_t timeout)
```

Sets the setting for the read timeout of every single connection.

7.20.3.16 setUnitMap()

```
void ModbusTcpServer::setUnitMap (
    const void * unitmap) [override], [virtual]
```

Set units map of current server. Server make a copy of units map data.

See also

[unitMap\(\)](#)

Reimplemented from [ModbusServerPort](#).

7.20.3.17 signalCloseConnection()

```
void ModbusTcpServer::signalCloseConnection (
    const Modbus::Char * source)
```

Signal occurred when TCP connection was closed. `source` - name of the current connection.

7.20.3.18 signalNewConnection()

```
void ModbusTcpServer::signalNewConnection (
    const Modbus::Char * source)
```

Signal occurred when new TCP connection was accepted. `source` - name of the current connection.

7.20.3.19 timeout()

```
uint32_t ModbusTcpServer::timeout () const
```

Returns the setting for the read timeout of every single connection.

7.20.3.20 type()

```
Modbus::ProtocolType ModbusTcpServer::type () const [inline], [override], [virtual]
```

Returns the [Modbus](#) protocol type. In this case it is [Modbus : : TCP](#).

Implements [ModbusServerPort](#).

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusTcpServer.h](#)

7.21 Modbus::SerialSettings Struct Reference

Struct to define settings for Serial Port.

```
#include <ModbusGlobal.h>
```

Public Attributes

- const [Char](#) * **portName**
Value for the serial port name.
- int32_t **baudRate**
Value for the serial port's baud rate.
- int8_t **dataBits**
Value for the serial port's data bits.
- [Parity](#) **parity**
Value for the serial port's patiry.
- [StopBits](#) **stopBits**
Value for the serial port's stop bits.
- [FlowControl](#) **flowControl**
Value for the serial port's flow control.
- uint32_t **timeoutFirstByte**
Value for the serial port's timeout waiting first byte of packet.
- uint32_t **timeoutInterByte**
Value for the serial port's timeout waiting next byte of packet.

7.21.1 Detailed Description

Struct to define settings for Serial Port.

The documentation for this struct was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusGlobal.h](#)

7.22 Modbus::Strings Class Reference

Sets constant key values for the map of settings.

```
#include <ModbusQt.h>
```

Public Member Functions

- [Strings](#) ()

Static Public Member Functions

- static const [Strings](#) & [instance](#) ()

Public Attributes

- const QString **unit**
Setting key for the unit number of remote device.
- const QString **type**
Setting key for the type of [Modbus](#) protocol.
- const QString **tries**
Setting key for the number of tries a [Modbus](#) request is repeated if it fails.
- const QString **host**
Setting key for the IP address or DNS name of the remote device.
- const QString **port**
Setting key for the TCP port number of the remote device.
- const QString **timeout**
Setting key for connection timeout (milliseconds)
- const QString **maxconn**
Setting key for the maximum number of simultaneous connections to the server.
- const QString **serialPortName**
Setting key for the serial port name.
- const QString **baudRate**
Setting key for the serial port's baud rate.
- const QString **dataBits**
Setting key for the serial port's data bits.
- const QString **parity**
Setting key for the serial port's parity.
- const QString **stopBits**
Setting key for the serial port's stop bits.
- const QString **flowControl**
Setting key for the serial port's flow control.
- const QString **timeoutFirstByte**
Setting key for the serial port's timeout waiting first byte of packet.
- const QString **timeoutInterByte**
Setting key for the serial port's timeout waiting next byte of packet.
- const QString **isBroadcastEnabled**
Setting key for the serial port enables broadcast mode for 0 unit address.
- const QString **NoParity**

- String constant for repr of NoParity enum value.*
- const QString **EvenParity**
String constant for repr of EvenParity enum value.
- const QString **OddParity**
String constant for repr of OddParity enum value.
- const QString **SpaceParity**
String constant for repr of SpaceParity enum value.
- const QString **MarkParity**
String constant for repr of MarkParity enum value.
- const QString **OneStop**
String constant for repr of OneStop enum value.
- const QString **OneAndHalfStop**
String constant for repr of OneAndHalfStop enum value.
- const QString **TwoStop**
String constant for repr of TwoStop enum value.
- const QString **NoFlowControl**
String constant for repr of NoFlowControl enum value.
- const QString **HardwareControl**
String constant for repr of HardwareControl enum value.
- const QString **SoftwareControl**
String constant for repr of SoftwareControl enum value.

7.22.1 Detailed Description

Sets constant key values for the map of settings.

7.22.2 Constructor & Destructor Documentation

7.22.2.1 Strings()

```
Modbus::Strings::Strings ()
```

Constructor of the class.

7.22.3 Member Function Documentation

7.22.3.1 instance()

```
static const Strings & Modbus::Strings::instance () [static]
```

Returns a reference to the global `Modbus::Strings` object.

The documentation for this class was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusQt.h

7.23 Modbus::TcpSettings Struct Reference

Struct to define settings for TCP connection.

```
#include <ModbusGlobal.h>
```

Public Attributes

- const [Char](#) * **host**
Value for the IP address or DNS name of the remote device.
- uint16_t **port**
Value for the TCP port number of the remote device.
- uint32_t **timeout**
Value for connection timeout (milliseconds)
- uint32_t **maxconn**
Maximum number of simultaneous connections to the server (for server side only)

7.23.1 Detailed Description

Struct to define settings for TCP connection.

The documentation for this struct was generated from the following file:

- C:/Users/march/Dropbox/PRJ/ModbusLib/src/[ModbusGlobal.h](#)

Chapter 8

File Documentation

8.1 C:/Users/march/Dropbox/PRJ/ModbusLib/src/cModbus.h File Reference

8.1.1 Detailed Description

Contains library interface for C language.

Author

serhmarch

Date

May 2024

8.1.2 Typedef Documentation

8.1.2.1 pfDiagnostics

```
typedef StatusCode(* pfDiagnostics) (cModbusDevice dev, uint8_t unit, uint16_t subfunc, uint8_t insize, const void *indata, uint8_t *outsize, void *outdata)
```

Pointer to C function for diagnostics. dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::diagnostics](#)

8.1.2.2 pfGetCommEventCounter

```
typedef StatusCode(* pfGetCommEventCounter) (cModbusDevice dev, uint8_t unit, uint16_t *status, uint16_t *eventCount)
```

Pointer to C function for get communication event counter. dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::getCommEventCounter](#)

8.1.2.3 pfGetCommEventLog

```
typedef StatusCode(* pfGetCommEventLog) (cModbusDevice dev, uint8_t unit, uint16_t *status, uint16_t *eventCount, uint16_t *messageCount, uint8_t *eventBuffSize, uint8_t *eventBuff)
```

Pointer to C function for get communication event logs. dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::getCommEventLog](#)

8.1.2.4 pfMaskWriteRegister

```
typedef StatusCode(* pfMaskWriteRegister) (cModbusDevice dev, uint8_t unit, uint16_t offset,  
uint16_t andMask, uint16_t orMask)
```

Pointer to C function for mask write registers (4x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::maskWriteRegister](#)

8.1.2.5 pfReadCoils

```
typedef StatusCode(* pfReadCoils) (cModbusDevice dev, uint8_t unit, uint16_t offset, uint16_t  
count, void *values)
```

Pointer to C function for read coils (0x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::readCoils](#)

8.1.2.6 pfReadDiscreteInputs

```
typedef StatusCode(* pfReadDiscreteInputs) (cModbusDevice dev, uint8_t unit, uint16_t offset,  
uint16_t count, void *values)
```

Pointer to C function for read discrete inputs (1x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::readDiscreteInputs](#)

8.1.2.7 pfReadExceptionStatus

```
typedef StatusCode(* pfReadExceptionStatus) (cModbusDevice dev, uint8_t unit, uint8_t *status)
```

Pointer to C function for read exception status bits. dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::readExceptionStatus](#)

8.1.2.8 pfReadFIFOQueue

```
typedef StatusCode(* pfReadFIFOQueue) (cModbusDevice dev, uint8_t unit, uint16_t fifoadr,  
uint16_t *count, uint16_t *values)
```

Pointer to C function for read FIFO queue. dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::readFIFOQueue](#)

8.1.2.9 pfReadHoldingRegisters

```
typedef StatusCode(* pfReadHoldingRegisters) (cModbusDevice dev, uint8_t unit, uint16_t offset,  
uint16_t count, uint16_t *values)
```

Pointer to C function for read holding registers (4x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::readHoldingRegisters](#)

8.1.2.10 pfReadInputRegisters

```
typedef StatusCode(* pfReadInputRegisters) (cModbusDevice dev, uint8_t unit, uint16_t offset,  
uint16_t count, uint16_t *values)
```

Pointer to C function for read input registers (3x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::readInputRegisters](#)

8.1.2.11 pfReadWriteMultipleRegisters

```
typedef StatusCode(* pfReadWriteMultipleRegisters) (cModbusDevice dev, uint8_t unit, uint16_t  
readOffset, uint16_t readCount, uint16_t *readValues, uint16_t writeOffset, uint16_t write↔  
Count, const uint16_t *writeValues)
```

Pointer to C function for write registers (4x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::writeMultipleRegisters](#)

8.1.2.12 pfReportServerID

```
typedef StatusCode(* pfReportServerID) (cModbusDevice dev, uint8_t unit, uint8_t *count, uint8_t *data)
```

Pointer to C function for report server id. dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::reportServerID](#)

8.1.2.13 pfSlotCloseConnection

```
typedef void(* pfSlotCloseConnection) (const Char *source)
```

Pointer to C callback function. dev - pointer to any struct that can hold memory data.

See also

[ModbusTcpServer::signalCloseConnection](#)

8.1.2.14 pfSlotClosed

```
typedef void(* pfSlotClosed) (const Char *source)
```

Pointer to C callback function. dev - pointer to any struct that can hold memory data.

See also

[ModbusClientPort::signalClosed](#) and [ModbusServerPort::signalClosed](#)

8.1.2.15 pfSlotError

```
typedef void(* pfSlotError) (const Char *source, StatusCode status, const Char *text)
```

Pointer to C callback function. dev - pointer to any struct that can hold memory data.

See also

[ModbusClientPort::signalError](#) and [ModbusServerPort::signalError](#)

8.1.2.16 pfSlotNewConnection

```
typedef void(* pfSlotNewConnection) (const Char *source)
```

Pointer to C callback function. dev - pointer to any struct that can hold memory data.

See also

[ModbusTcpServer::signalNewConnection](#)

8.1.2.17 pfSlotOpened

```
typedef void(* pfSlotOpened) (const Char *source)
```

Pointer to C callback function. dev - pointer to any struct that can hold memory data.

See also

[ModbusClientPort::signalOpened](#) and [ModbusServerPort::signalOpened](#)

8.1.2.18 pfSlotRx

```
typedef void(* pfSlotRx) (const Char *source, const uint8_t *buff, uint16_t size)
```

Pointer to C callback function. dev - pointer to any struct that can hold memory data.

See also

[ModbusClientPort::signalRx](#) and [ModbusServerPort::signalRx](#)

8.1.2.19 pfSlotTx

```
typedef void(* pfSlotTx) (const Char *source, const uint8_t *buff, uint16_t size)
```

Pointer to C callback function. dev - pointer to any struct that can hold memory data.

See also

[ModbusClientPort::signalTx](#) and [ModbusServerPort::signalTx](#)

8.1.2.20 pfWriteMultipleCoils

```
typedef StatusCode(* pfWriteMultipleCoils) (cModbusDevice dev, uint8_t unit, uint16_t offset,  
uint16_t count, const void *values)
```

Pointer to C function for write coils (0x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::writeMultipleCoils](#)

8.1.2.21 pfWriteMultipleRegisters

```
typedef StatusCode(* pfWriteMultipleRegisters) (cModbusDevice dev, uint8_t unit, uint16_t  
offset, uint16_t count, const uint16_t *values)
```

Pointer to C function for write registers (4x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::writeMultipleRegisters](#)

8.1.2.22 pfWriteSingleCoil

```
typedef StatusCode(* pfWriteSingleCoil) (cModbusDevice dev, uint8_t unit, uint16_t offset,  
bool value)
```

Pointer to C function for write single coil (0x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::writeSingleCoil](#)

8.1.2.23 pfWriteSingleRegister

```
typedef StatusCode(* pfWriteSingleRegister) (cModbusDevice dev, uint8_t unit, uint16_t offset,  
uint16_t value)
```

Pointer to C function for write single register (4x). dev - pointer to any struct that can hold memory data.

See also

[ModbusInterface::writeSingleRegister](#)

8.1.3 Function Documentation

8.1.3.1 cCliCreate()

```
MODBUS\_EXPORT cModbusClient cCliCreate (  
    uint8_t unit,  
    ProtocolType type,  
    const void * settings,  
    bool blocking)
```

Creates [ModbusClient](#) object and returns handle to it.

See also

[Modbus::createClient](#)

8.1.3.2 cCliCreateForClientPort()

```
MODBUS\_EXPORT cModbusClient cCliCreateForClientPort (  
    uint8_t unit,  
    cModbusClientPort clientPort)
```

Creates [ModbusClient](#) object with unit for port clientPort and returns handle to it.

8.1.3.3 cCliDelete()

```
MODBUS_EXPORT void cCliDelete (
    cModbusClient client)
```

Deletes previously created `ModbusClient` object represented by `client` handle

8.1.3.4 cCliGetLastPortErrorStatus()

```
MODBUS_EXPORT StatusCode cCliGetLastPortErrorStatus (
    cModbusClient client)
```

Wrapper for `ModbusClient::lastPortErrorStatus`

8.1.3.5 cCliGetLastPortErrorText()

```
MODBUS_EXPORT const Char * cCliGetLastPortErrorText (
    cModbusClient client)
```

Wrapper for `ModbusClient::lastPortErrorText`

8.1.3.6 cCliGetLastPortStatus()

```
MODBUS_EXPORT StatusCode cCliGetLastPortStatus (
    cModbusClient client)
```

Wrapper for `ModbusClient::lastPortStatus`

8.1.3.7 cCliGetObjectName()

```
MODBUS_EXPORT const Char * cCliGetObjectName (
    cModbusClient client)
```

Wrapper for `ModbusClient::objectName`

8.1.3.8 cCliGetPort()

```
MODBUS_EXPORT cModbusClientPort cCliGetPort (
    cModbusClient client)
```

Wrapper for `ModbusClient::port`

8.1.3.9 cCliGetType()

```
MODBUS_EXPORT ProtocolType cCliGetType (
    cModbusClient client)
```

Wrapper for `ModbusClient::type`

8.1.3.10 cCliGetUnit()

```
MODBUS_EXPORT uint8_t cCliGetUnit (  
    cModbusClient client)
```

Wrapper for `ModbusClient::unit`

8.1.3.11 cCliIsOpen()

```
MODBUS_EXPORT bool cCliIsOpen (  
    cModbusClient client)
```

Wrapper for `ModbusClient::isOpen`

8.1.3.12 cCliSetObjectName()

```
MODBUS_EXPORT void cCliSetObjectName (  
    cModbusClient client,  
    const Char * name)
```

Wrapper for `ModbusClient::setObjectName`

8.1.3.13 cCliSetUnit()

```
MODBUS_EXPORT void cCliSetUnit (  
    cModbusClient client,  
    uint8_t unit)
```

Wrapper for `ModbusClient::setUnit`

8.1.3.14 cCpoClose()

```
MODBUS_EXPORT bool cCpoClose (  
    cModbusClientPort clientPort)
```

Wrapper for `ModbusClientPort::close`

8.1.3.15 cCpoConnectClosed()

```
MODBUS_EXPORT void cCpoConnectClosed (  
    cModbusClientPort clientPort,  
    pfSlotClosed funcPtr)
```

Connects `funcPtr`-function to `ModbusClientPort::signalClosed` signal

8.1.3.16 cCpoConnectError()

```
MODBUS_EXPORT void cCpoConnectError (  
    cModbusClientPort clientPort,  
    pfSlotError funcPtr)
```

Connects `funcPtr`-function to `ModbusClientPort::signalError` signal

8.1.3.17 cCpoConnectOpened()

```
MODBUS_EXPORT void cCpoConnectOpened (  
    cModbusClientPort clientPort,  
    pfSlotOpened funcPtr)
```

Connects `funcPtr`-function to `ModbusClientPort::signalOpened` signal

8.1.3.18 cCpoConnectRx()

```
MODBUS_EXPORT void cCpoConnectRx (  
    cModbusClientPort clientPort,  
    pfSlotRx funcPtr)
```

Connects `funcPtr`-function to `ModbusClientPort::signalRx` signal

8.1.3.19 cCpoConnectTx()

```
MODBUS_EXPORT void cCpoConnectTx (  
    cModbusClientPort clientPort,  
    pfSlotTx funcPtr)
```

Connects `funcPtr`-function to `ModbusClientPort::signalTx` signal

8.1.3.20 cCpoCreate()

```
MODBUS_EXPORT cModbusClientPort cCpoCreate (  
    ProtocolType type,  
    const void * settings,  
    bool blocking)
```

Creates `ModbusClientPort` object and returns handle to it.

See also

`Modbus::createClientPort`

8.1.3.21 cCpoCreateForPort()

```
MODBUS_EXPORT cModbusClientPort cCpoCreateForPort (  
    cModbusPort port)
```

Creates `ModbusClientPort` object and returns handle to it.

8.1.3.22 cCpoDelete()

```
MODBUS_EXPORT void cCpoDelete (
    cModbusClientPort clientPort)
```

Deletes previously created `ModbusClientPort` object represented by `port` handle

8.1.3.23 cCpoDiagnostics()

```
MODBUS_EXPORT StatusCode cCpoDiagnostics (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t subfunc,
    uint8_t insize,
    const void * indata,
    uint8_t * outsize,
    void * outdata)
```

Wrapper for `ModbusClientPort::diagnostics`

8.1.3.24 cCpoDisconnectFunc()

```
MODBUS_EXPORT void cCpoDisconnectFunc (
    cModbusClientPort clientPort,
    void * funcPtr)
```

Disconnects `funcPtr`-function from `ModbusClientPort`

8.1.3.25 cCpoGetCommEventCounter()

```
MODBUS_EXPORT StatusCode cCpoGetCommEventCounter (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t * status,
    uint16_t * eventCount)
```

Wrapper for `ModbusClientPort::getCommEventCounter`

8.1.3.26 cCpoGetCommEventLog()

```
MODBUS_EXPORT StatusCode cCpoGetCommEventLog (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t * status,
    uint16_t * eventCount,
    uint16_t * messageCount,
    uint8_t * eventBuffSize,
    uint8_t * eventBuff)
```

Wrapper for `ModbusClientPort::getCommEventLog`

8.1.3.27 cCpoGetLastErrorStatus()

```
MODBUS_EXPORT StatusCode cCpoGetLastErrorStatus (  
    cModbusClientPort clientPort)
```

Wrapper for `ModbusClientPort::getLastErrorStatus`

8.1.3.28 cCpoGetLastErrorText()

```
MODBUS_EXPORT const Char * cCpoGetLastErrorText (  
    cModbusClientPort clientPort)
```

Wrapper for `ModbusClientPort::getLastErrorText`

8.1.3.29 cCpoGetLastStatus()

```
MODBUS_EXPORT StatusCode cCpoGetLastStatus (  
    cModbusClientPort clientPort)
```

Wrapper for `ModbusClientPort::getLastStatus`

8.1.3.30 cCpoGetObjectName()

```
MODBUS_EXPORT const Char * cCpoGetObjectName (  
    cModbusClientPort clientPort)
```

Wrapper for `ModbusClientPort::objectName`

8.1.3.31 cCpoGetRepeatCount()

```
MODBUS_EXPORT uint32_t cCpoGetRepeatCount (  
    cModbusClientPort clientPort)
```

Wrapper for `ModbusClientPort::repeatCount`

8.1.3.32 cCpoGetType()

```
MODBUS_EXPORT ProtocolType cCpoGetType (  
    cModbusClientPort clientPort)
```

Wrapper for `ModbusClientPort::type`

8.1.3.33 cCpolsOpen()

```
MODBUS_EXPORT bool cCpoIsOpen (  
    cModbusClientPort clientPort)
```

Wrapper for `ModbusClientPort::isOpen`

8.1.3.34 cCpoMaskWriteRegister()

```
MODBUS_EXPORT StatusCode cCpoMaskWriteRegister (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    uint16_t andMask,
    uint16_t orMask)
```

Wrapper for `ModbusClientPort::maskWriteRegister`

8.1.3.35 cCpoReadCoils()

```
MODBUS_EXPORT StatusCode cCpoReadCoils (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    void * values)
```

Wrapper for `ModbusClientPort::readCoils`

8.1.3.36 cCpoReadCoilsAsBoolArray()

```
MODBUS_EXPORT StatusCode cCpoReadCoilsAsBoolArray (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    bool * values)
```

Wrapper for `ModbusClientPort::readCoilsAsBoolArray`

8.1.3.37 cCpoReadDiscreteInputs()

```
MODBUS_EXPORT StatusCode cCpoReadDiscreteInputs (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    void * values)
```

Wrapper for `ModbusClientPort::readDiscreteInputs`

8.1.3.38 cCpoReadDiscreteInputsAsBoolArray()

```
MODBUS_EXPORT StatusCode cCpoReadDiscreteInputsAsBoolArray (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    bool * values)
```

Wrapper for `ModbusClientPort::readDiscreteInputsAsBoolArray`

8.1.3.39 cCpoReadExceptionStatus()

```
MODBUS_EXPORT StatusCode cCpoReadExceptionStatus (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint8_t * value)
```

Wrapper for `ModbusClientPort::readExceptionStatus`

8.1.3.40 cCpoReadFIFOQueue()

```
MODBUS_EXPORT StatusCode cCpoReadFIFOQueue (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t fifoadr,
    uint16_t * count,
    uint16_t * values)
```

Wrapper for `ModbusClientPort::readFIFOQueue`

8.1.3.41 cCpoReadHoldingRegisters()

```
MODBUS_EXPORT StatusCode cCpoReadHoldingRegisters (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    uint16_t * values)
```

Wrapper for `ModbusClientPort::readHoldingRegisters`

8.1.3.42 cCpoReadInputRegisters()

```
MODBUS_EXPORT StatusCode cCpoReadInputRegisters (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    uint16_t * values)
```

Wrapper for `ModbusClientPort::readInputRegisters`

8.1.3.43 cCpoReadWriteMultipleRegisters()

```
MODBUS_EXPORT StatusCode cCpoReadWriteMultipleRegisters (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t readOffset,
    uint16_t readCount,
    uint16_t * readValues,
    uint16_t writeOffset,
    uint16_t writeCount,
    const uint16_t * writeValues)
```

Wrapper for `ModbusClientPort::readWriteMultipleRegisters`

8.1.3.44 cCpoReportServerID()

```
MODBUS_EXPORT StatusCode cCpoReportServerID (  
    cModbusClientPort clientPort,  
    uint8_t unit,  
    uint8_t * count,  
    uint8_t * data)
```

Wrapper for `ModbusClientPort::reportServerID`

8.1.3.45 cCpoSetObjectName()

```
MODBUS_EXPORT void cCpoSetObjectName (  
    cModbusClientPort clientPort,  
    const Char * name)
```

Wrapper for `ModbusClientPort::setObjectName`

8.1.3.46 cCpoSetRepeatCount()

```
MODBUS_EXPORT void cCpoSetRepeatCount (  
    cModbusClientPort clientPort,  
    uint32_t count)
```

Wrapper for `ModbusClientPort::setRepeatCount`

8.1.3.47 cCpoWriteMultipleCoils()

```
MODBUS_EXPORT StatusCode cCpoWriteMultipleCoils (  
    cModbusClientPort clientPort,  
    uint8_t unit,  
    uint16_t offset,  
    uint16_t count,  
    const void * values)
```

Wrapper for `ModbusClientPort::writeMultipleCoils`

8.1.3.48 cCpoWriteMultipleCoilsAsBoolArray()

```
MODBUS_EXPORT StatusCode cCpoWriteMultipleCoilsAsBoolArray (  
    cModbusClientPort clientPort,  
    uint8_t unit,  
    uint16_t offset,  
    uint16_t count,  
    const bool * values)
```

Wrapper for `ModbusClientPort::writeMultipleCoilsAsBoolArray`

8.1.3.49 cCpoWriteMultipleRegisters()

```
MODBUS_EXPORT StatusCode cCpoWriteMultipleRegisters (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    uint16_t count,
    const uint16_t * values)
```

Wrapper for `ModbusClientPort::writeMultipleRegisters`

8.1.3.50 cCpoWriteSingleCoil()

```
MODBUS_EXPORT StatusCode cCpoWriteSingleCoil (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    bool value)
```

Wrapper for `ModbusClientPort::writeSingleCoil`

8.1.3.51 cCpoWriteSingleRegister()

```
MODBUS_EXPORT StatusCode cCpoWriteSingleRegister (
    cModbusClientPort clientPort,
    uint8_t unit,
    uint16_t offset,
    uint16_t value)
```

Wrapper for `ModbusClientPort::writeSingleRegister`

8.1.3.52 cCreateModbusDevice()

```
MODBUS_EXPORT cModbusInterface cCreateModbusDevice (
    cModbusDevice device,
    pfReadCoils readCoils,
    pfReadDiscreteInputs readDiscreteInputs,
    pfReadHoldingRegisters readHoldingRegisters,
    pfReadInputRegisters readInputRegisters,
    pfWriteSingleCoil writeSingleCoil,
    pfWriteSingleRegister writeSingleRegister,
    pfReadExceptionStatus readExceptionStatus,
    pfDiagnostics diagnostics,
    pfGetCommEventCounter getCommEventCounter,
    pfGetCommEventLog getCommEventLog,
    pfWriteMultipleCoils writeMultipleCoils,
    pfWriteMultipleRegisters writeMultipleRegisters,
    pfReportServerID reportServerID,
    pfMaskWriteRegister maskWriteRegister,
    pfReadWriteMultipleRegisters readWriteMultipleRegisters,
    pfReadFIFOQueue readFIFOQueue)
```

Function create `ModbusInterface` object and returns pointer to it for server. `dev` - pointer to any struct that can hold memory data. `readCoils`, `readDiscreteInputs`, `readHoldingRegisters`, `readInputRegisters`, `writeSingleCoil`, `writeSingleRegister`, `readExceptionStatus`, `diagnostics`, `getCommEventCounter`, `getCommEventLog`, `writeMultipleCoils`, `writeMultipleRegisters`, `reportServerID`, `maskWriteRegister`, `readWriteMultipleRegisters`, `readFIFOQueue` - pointers to corresponding `Modbus` functions to process data. Any pointer can have `NULL` value. In this case server will return `Status_BadIllegalFunction`.

8.1.3.53 cDeleteModbusDevice()

```
MODBUS_EXPORT void cDeleteModbusDevice (  
    cModbusInterface dev)
```

Deletes previously created [ModbusInterface](#) object represented by `dev` handle

8.1.3.54 cMaskWriteRegister()

```
MODBUS_EXPORT StatusCode cMaskWriteRegister (  
    cModbusClient client,  
    uint16_t offset,  
    uint16_t andMask,  
    uint16_t orMask)
```

Wrapper for [ModbusClient::maskWriteRegister](#)

8.1.3.55 cPortCreate()

```
MODBUS_EXPORT cModbusPort cPortCreate (  
    ProtocolType type,  
    const void * settings,  
    bool blocking)
```

Creates [ModbusPort](#) object and returns handle to it.

See also

[Modbus::createPort](#)

8.1.3.56 cPortDelete()

```
MODBUS_EXPORT void cPortDelete (  
    cModbusPort port)
```

Deletes previously created [ModbusPort](#) object represented by `port` handle

8.1.3.57 cReadCoils()

```
MODBUS_EXPORT StatusCode cReadCoils (  
    cModbusClient client,  
    uint16_t offset,  
    uint16_t count,  
    void * values)
```

Wrapper for [ModbusClient::readCoils](#)

8.1.3.58 cReadCoilsAsBoolArray()

```
MODBUS_EXPORT StatusCode cReadCoilsAsBoolArray (
    cModbusClient client,
    uint16_t offset,
    uint16_t count,
    bool * values)
```

Wrapper for `ModbusClient::readCoilsAsBoolArray`

8.1.3.59 cReadDiscreteInputs()

```
MODBUS_EXPORT StatusCode cReadDiscreteInputs (
    cModbusClient client,
    uint16_t offset,
    uint16_t count,
    void * values)
```

Wrapper for `ModbusClient::readDiscreteInputs`

8.1.3.60 cReadDiscreteInputsAsBoolArray()

```
MODBUS_EXPORT StatusCode cReadDiscreteInputsAsBoolArray (
    cModbusClient client,
    uint16_t offset,
    uint16_t count,
    bool * values)
```

Wrapper for `ModbusClient::readDiscreteInputsAsBoolArray`

8.1.3.61 cReadExceptionStatus()

```
MODBUS_EXPORT StatusCode cReadExceptionStatus (
    cModbusClient client,
    uint8_t * value)
```

Wrapper for `ModbusClient::readExceptionStatus`

8.1.3.62 cReadHoldingRegisters()

```
MODBUS_EXPORT StatusCode cReadHoldingRegisters (
    cModbusClient client,
    uint16_t offset,
    uint16_t count,
    uint16_t * values)
```

Wrapper for `ModbusClient::readHoldingRegisters`

8.1.3.63 cReadInputRegisters()

```
MODBUS_EXPORT StatusCode cReadInputRegisters (
    cModbusClient client,
    uint16_t offset,
    uint16_t count,
    uint16_t * values)
```

Wrapper for `ModbusClient::readInputRegisters`

8.1.3.64 cReadWriteMultipleRegisters()

```
MODBUS_EXPORT StatusCode cReadWriteMultipleRegisters (
    cModbusClient client,
    uint16_t readOffset,
    uint16_t readCount,
    uint16_t * readValues,
    uint16_t writeOffset,
    uint16_t writeCount,
    const uint16_t * writeValues)
```

Wrapper for `ModbusClient::readWriteMultipleRegisters`

8.1.3.65 cSpoClose()

```
MODBUS_EXPORT StatusCode cSpoClose (
    cModbusServerPort serverPort)
```

Wrapper for `ModbusServerPort::close`

8.1.3.66 cSpoConnectCloseConnection()

```
MODBUS_EXPORT void cSpoConnectCloseConnection (
    cModbusServerPort serverPort,
    pfSlotCloseConnection funcPtr)
```

Connects `funcPtr`-function to `ModbusServerPort::signalCloseConnection` signal

8.1.3.67 cSpoConnectClosed()

```
MODBUS_EXPORT void cSpoConnectClosed (
    cModbusServerPort serverPort,
    pfSlotClosed funcPtr)
```

Connects `funcPtr`-function to `ModbusServerPort::signalClosed` signal

8.1.3.68 cSpoConnectError()

```
MODBUS_EXPORT void cSpoConnectError (
    cModbusServerPort serverPort,
    pfSlotError funcPtr)
```

Connects funcPtr-function to `ModbusServerPort::signalError` signal

8.1.3.69 cSpoConnectNewConnection()

```
MODBUS_EXPORT void cSpoConnectNewConnection (
    cModbusServerPort serverPort,
    pfSlotNewConnection funcPtr)
```

Connects funcPtr-function to `ModbusServerPort::signalNewConnection` signal

8.1.3.70 cSpoConnectOpened()

```
MODBUS_EXPORT void cSpoConnectOpened (
    cModbusServerPort serverPort,
    pfSlotOpened funcPtr)
```

Connects funcPtr-function to `ModbusServerPort::signalOpened` signal

8.1.3.71 cSpoConnectRx()

```
MODBUS_EXPORT void cSpoConnectRx (
    cModbusServerPort serverPort,
    pfSlotRx funcPtr)
```

Connects funcPtr-function to `ModbusServerPort::signalRx` signal

8.1.3.72 cSpoConnectTx()

```
MODBUS_EXPORT void cSpoConnectTx (
    cModbusServerPort serverPort,
    pfSlotTx funcPtr)
```

Connects funcPtr-function to `ModbusServerPort::signalTx` signal

8.1.3.73 cSpoCreate()

```
MODBUS_EXPORT cModbusServerPort cSpoCreate (
    cModbusInterface device,
    ProtocolType type,
    const void * settings,
    bool blocking)
```

Creates `ModbusServerPort` object and returns handle to it.

See also

`Modbus::createServerPort`

8.1.3.74 cSpoDelete()

```
MODBUS_EXPORT void cSpoDelete (
    cModbusServerPort serverPort)
```

Deletes previously created `ModbusServerPort` object represented by `serverPort` handle

8.1.3.75 cSpoDisconnectFunc()

```
MODBUS_EXPORT void cSpoDisconnectFunc (
    cModbusServerPort serverPort,
    void * funcPtr)
```

Disconnects `funcPtr`-function from `ModbusServerPort`

8.1.3.76 cSpoGetDevice()

```
MODBUS_EXPORT cModbusInterface cSpoGetDevice (
    cModbusServerPort serverPort)
```

Wrapper for `ModbusServerPort::device`

8.1.3.77 cSpoGetObjectName()

```
MODBUS_EXPORT const Char * cSpoGetObjectName (
    cModbusServerPort serverPort)
```

Wrapper for `ModbusServerPort::objectName`

8.1.3.78 cSpoGetType()

```
MODBUS_EXPORT ProtocolType cSpoGetType (
    cModbusServerPort serverPort)
```

Wrapper for `ModbusServerPort::type`

8.1.3.79 cSpolsOpen()

```
MODBUS_EXPORT bool cSpoIsOpen (
    cModbusServerPort serverPort)
```

Wrapper for `ModbusServerPort::isOpen`

8.1.3.80 cSpolsTcpServer()

```
MODBUS_EXPORT bool cSpoIsTcpServer (
    cModbusServerPort serverPort)
```

Wrapper for `ModbusServerPort::isTcpServer`

8.1.3.81 cSpoOpen()

```
MODBUS_EXPORT StatusCode cSpoOpen (  
    cModbusServerPort serverPort)
```

Wrapper for `ModbusServerPort::open`

8.1.3.82 cSpoProcess()

```
MODBUS_EXPORT StatusCode cSpoProcess (  
    cModbusServerPort serverPort)
```

Wrapper for `ModbusServerPort::process`

8.1.3.83 cSpoSetObjectName()

```
MODBUS_EXPORT void cSpoSetObjectName (  
    cModbusServerPort serverPort,  
    const Char * name)
```

Wrapper for `ModbusServerPort::setObjectName`

8.1.3.84 cWriteMultipleCoils()

```
MODBUS_EXPORT StatusCode cWriteMultipleCoils (  
    cModbusClient client,  
    uint16_t offset,  
    uint16_t count,  
    const void * values)
```

Wrapper for `ModbusClient::writeMultipleCoils`

8.1.3.85 cWriteMultipleCoilsAsBoolArray()

```
MODBUS_EXPORT StatusCode cWriteMultipleCoilsAsBoolArray (  
    cModbusClient client,  
    uint16_t offset,  
    uint16_t count,  
    const bool * values)
```

Wrapper for `ModbusClient::lastPortStatus`

8.1.3.86 cWriteMultipleRegisters()

```
MODBUS_EXPORT StatusCode cWriteMultipleRegisters (  
    cModbusClient client,  
    uint16_t offset,  
    uint16_t count,  
    const uint16_t * values)
```

Wrapper for `ModbusClient::writeMultipleRegisters`

8.1.3.87 cWriteSingleCoil()

```
MODBUS_EXPORT StatusCode cWriteSingleCoil (
    cModbusClient client,
    uint16_t offset,
    bool value)
```

Wrapper for `ModbusClient::writeSingleCoil`

8.1.3.88 cWriteSingleRegister()

```
MODBUS_EXPORT StatusCode cWriteSingleRegister (
    cModbusClient client,
    uint16_t offset,
    uint16_t value)
```

Wrapper for `ModbusClient::writeSingleRegister`

```

8.3 C:/Users/march/Dropbox/PRJ/ModbusLib/src/Modbus.h File Reference

Contains general definitions of the [Modbus](#) protocol.

```
#include <string>
#include <list>
#include "ModbusGlobal.h"
```

Classes

- class [ModbusInterface](#)
Main interface of [Modbus](#) communication protocol.
- class [Modbus::Address](#)
[Modbus](#) Data [Address](#) class. Represents [Modbus](#) Data [Address](#).

Namespaces

- namespace [Modbus](#)
Main [Modbus](#) namespace. Contains classes, functions and constants to work with [Modbus](#)-protocol.

Macros

- #define **sIEC61131Prefix0x** "%Q"
- #define **sIEC61131Prefix1x** "%I"
- #define **sIEC61131Prefix3x** "%IW"
- #define **sIEC61131Prefix4x** "%MW"
- #define **cIEC61131SuffixHex** 'h'

Typedefs

- typedef std::string **Modbus::String**
[Modbus::String](#) class for strings.
- template<class T >
using **Modbus::List** = std::list<T>
[Modbus::List](#) template class.

Functions

- [MODBUS_EXPORT String Modbus::getLastErrorText \(\)](#)
- [MODBUS_EXPORT String Modbus::trim \(const String &str\)](#)
- [template<class StringT, class T > StringT Modbus::toBinString \(T value\)](#)
- [template<class StringT, class T > StringT Modbus::toOctString \(T value\)](#)
- [template<class StringT, class T > StringT Modbus::toHexString \(T value\)](#)

8.6 C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusAscPort.h File Reference

Contains definition of ASCII serial port class.

```
#include "ModbusSerialPort.h"
```

Classes

- class [ModbusAscPort](#)
Implements ASCII version of the [Modbus](#) communication protocol.

8.6.1 Detailed Description

Contains definition of ASCII serial port class.

Contains definition of base server side port class.

```

8.12 C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusGlobal.h File Reference

Contains general definitions of the [Modbus](#) library (for C++ and "pure" C).

```

#include <stdint.h>
#include <string.h>
#include "ModbusPlatform.h"
#include "Modbus_config.h"

```

Classes

- struct [Modbus::SerialSettings](#)
Struct to define settings for Serial Port.
- struct [Modbus::TcpSettings](#)
Struct to define settings for TCP connection.

Namespaces

- namespace [Modbus](#)
Main [Modbus](#) namespace. Contains classes, functions and constants to work with Modbus-protocol.

Macros

- #define **MODBUSLIB_VERSION** ((MODBUSLIB_VERSION_MAJOR<<16)|(MODBUSLIB_VERSION_↵
MINOR<<8)|(MODBUSLIB_VERSION_PATCH))
ModbusLib version value that defines as MODBUSLIB_VERSION = (major << 16) + (minor << 8) + patch.
- #define **MODBUSLIB_VERSION_STR** MODBUSLIB_VERSION_STR_MAKE(MODBUSLIB_VERSION_↵
MAJOR,MODBUSLIB_VERSION_MINOR,MODBUSLIB_VERSION_PATCH)
ModbusLib version value that defines as MODBUSLIB_VERSION_STR "major.minor.patch".
- #define **MODBUS_EXPORT** MB_DECL_IMPORT
MODBUS_EXPORT defines macro for import/export functions and classes.
- #define [StringLiteral](#)(cstr)
Macro for creating string literal, must be used like: StringLiteral("Some string")
- #define [CharLiteral](#)(cchar)

- Macro for creating char literal, must be used like: `'CharLiteral('A')`.
- #define `GET_BIT`(bitBuff, bitNum)
 - Macro for get bit with number *bitNum* from array *bitBuff*.
- #define `SET_BIT`(bitBuff, bitNum, value)
 - Macro for set bit *value* with number *bitNum* to array *bitBuff*.
- #define `GET_BITS`(bitBuff, bitNum, bitCount, boolBuff)
 - Macro for get bits begins with number *bitNum* with *count* from input bit array *bitBuff* to output bool array *boolBuff*.
- #define `SET_BITS`(bitBuff, bitNum, bitCount, boolBuff)
 - Macro for set bits begins with number *bitNum* with *count* from input bool array *boolBuff* to output bit array *bitBuff*.
- #define `MB_UNITMAP_SIZE` 32
- #define `MB_UNITMAP_GET_BIT`(unitmap, unit)
- #define `MB_UNITMAP_SET_BIT`(unitmap, unit, value)
- #define `MB_BYTE_SZ_BITES` 8
 - 8 = count bits in byte (byte size in bits)
- #define `MB_REGE_SZ_BITES` 16
 - 16 = count bits in 16 bit register (register size in bits)
- #define `MB_REGE_SZ_BYTES` 2
 - 2 = count bytes in 16 bit register (register size in bytes)
- #define `MB_MAX_BYTES` 255
 - 255 - count_of_bytes in function *readHoldingRegisters*, *readCoils* etc
- #define `MB_MAX_REGISTERS` 127
 - 127 = 255(count_of_bytes in function *readHoldingRegisters* etc) / 2 (register size in bytes)
- #define `MB_MAX_DISCRETS` 2040
 - 2040 = 255(count_of_bytes in function *readCoils* etc) * 8 (bits in byte)
- #define `MB_VALUE_BUFF_SZ` 255
 - Same as *MB_MAX_BYTES*
- #define `MB_RTU_IO_BUFF_SZ` 264
 - Maximum func data size: *WriteMultipleCoils* 261 = 1 byte(function) + 2 bytes (starting offset) + 2 bytes (count) + 1 bytes (byte count) + 255 bytes(maximum data length)
- #define `MB_ASC_IO_BUFF_SZ` 529
 - 1 byte(start symbol ':') + ((1 byte(unit) + 261 (max func data size: *WriteMultipleCoils*) + 1 byte(LRC)))*2+2 bytes(CR+LF)
- #define `MB_TCP_IO_BUFF_SZ` 268
 - 6 bytes(tcp-prefix)+1 byte(unit)+261 (max func data size: *WriteMultipleCoils*)
- #define `GET_COMM_EVENT_LOG_MAX` 64
 - Maximum events for *GetCommEventLog* function.
- #define `READ_FIFO_QUEUE_MAX` 31
 - Maximum events for *GetCommEventLog* function.

Modbus Functions

Modbus Function's codes.

Typedefs

- typedef void * **Modbus::Handle**
Handle type for native OS values.
- typedef char **Modbus::Char**
Type for [Modbus](#) character.
- typedef uint32_t **Modbus::Timer**
Type for [Modbus](#) timer.
- typedef int64_t **Modbus::Timestamp**
Type for [Modbus](#) timestamp (in UNIX millisec format)
- typedef enum [Modbus::_MemoryType](#) **Modbus::MemoryType**
Defines type of memory used in [Modbus](#) protocol.
- typedef enum [Modbus::_Color](#) **Modbus::Color**
Enum of color (used for console text color).

Enumerations

- enum [Modbus::Constants](#) { [Modbus::VALID_MODBUS_ADDRESS_BEGIN](#) = 1 , [Modbus::VALID_MODBUS_ADDRESS_END](#) = 247 , [Modbus::STANDARD_TCP_PORT](#) = 502 }
Define list of constants of [Modbus](#) protocol.
- enum [Modbus::_MemoryType](#) {
[Modbus::Memory_Unknown](#) = 0xFFFF , [Modbus::Memory_0x](#) = 0 , [Modbus::Memory_Coils](#) = [Memory_0x](#) ,
[Modbus::Memory_1x](#) = 1 ,
[Modbus::Memory_DiscreteInputs](#) = [Memory_1x](#) , [Modbus::Memory_3x](#) = 3 , [Modbus::Memory_InputRegisters](#) = [Memory_3x](#) , [Modbus::Memory_4x](#) = 4 ,
[Modbus::Memory_HoldingRegisters](#) = [Memory_4x](#) }
Defines type of memory used in [Modbus](#) protocol.
- enum [Modbus::_Color](#) {
[Color_Black](#) , [Color_Red](#) , [Color_Green](#) , [Color_Yellow](#) ,
[Color_Blue](#) , [Color_Magenta](#) , [Color_Cyan](#) , [Color_White](#) ,
[Color_Default](#) }
Enum of color (used for console text color).
- enum [Modbus::StatusCode](#) {
[Modbus::Status_Processing](#) = 0x80000000 , [Modbus::Status_Good](#) = 0x00000000 , [Modbus::Status_Bad](#) = 0x01000000 , [Modbus::Status_Uncertain](#) = 0x02000000 ,

Modbus::Status_BadTcpConnect , Modbus::Status_BadTcpWrite ,
Modbus::Status_BadTcpRead , Modbus::Status_BadTcpBind , Modbus::Status_BadTcpListen , Modbus::Status_BadTcpAccep
,
Modbus::Status_BadTcpDisconnect }

```

Defines status of executed [Modbus](#) functions.

- enum [Modbus::ProtocolType](#) { [Modbus::ASC](#) , [Modbus::RTU](#) , [Modbus::TCP](#) }

Defines type of [Modbus](#) protocol.

- enum [Modbus::Parity](#) {
[Modbus::NoParity](#) , [Modbus::EvenParity](#) , [Modbus::OddParity](#) , [Modbus::SpaceParity](#) ,
[Modbus::MarkParity](#) }

Defines Parity for serial port.

- enum [Modbus::StopBits](#) { [Modbus::OneStop](#) , [Modbus::OneAndHalfStop](#) , [Modbus::TwoStop](#) }

Defines Stop Bits for serial port.

- enum [Modbus::FlowControl](#) { [Modbus::NoFlowControl](#) , [Modbus::HardwareControl](#) , [Modbus::SoftwareControl](#) }

FlowControl Parity for serial port.

Functions

- bool [Modbus::StatusIsProcessing](#) ([StatusCode](#) status)

8.12.1 Detailed Description

Contains general definitions of the `Modbus` library (for C++ and "pure" C).

Author

serhmarch

Date

May 2024

8.12.2 Macro Definition Documentation

8.12.2.1 CharLiteral

```
#define CharLiteral(  
    cchar)
```

Value:

`cchar`

Macro for creating char literal, must be used like: `'CharLiteral('A')`.

8.12.2.2 GET_BIT

```
#define GET_BIT(  
    bitBuff,  
    bitNum)
```

Value:

```
((((const uint8_t*)(bitBuff))[(bitNum)/8] & (1<<((bitNum)%8))) != 0)
```

Macro for get bit with number `bitNum` from array `bitBuff`.

8.12.2.3 GET_BITS

```
#define GET_BITS(  
    bitBuff,  
    bitNum,  
    bitCount,  
    boolBuff)
```

Value:

```
for (uint16_t __i__ = 0; __i__ < bitCount; __i__++)  
    boolBuff[__i__] = (((const uint8_t*)(bitBuff))[(bitNum)+__i__]/8] & (1<<(((bitNum)+__i__)%8))) != 0;
```

Macro for get bits begins with number `bitNum` with count from input bit array `bitBuff` to output bool array `boolBuff`.

8.12.2.4 MB_RTU_IO_BUFF_SZ

```
#define MB_RTU_IO_BUFF_SZ 264
```

Maximum func data size: WriteMultipleCoils 261 = 1 byte(function) + 2 bytes (starting offset) + 2 bytes (count) + 1 bytes (byte count) + 255 bytes(maximum data length)

1 byte(unit) + 261 (max func data size: WriteMultipleCoils) + 2 bytes(CRC)

8.12.2.5 MB_UNITMAP_GET_BIT

```
#define MB_UNITMAP_GET_BIT(  
    unitmap,  
    unit)
```

Value:

```
((((const uint8_t*)(unitmap))[(unit)/8] & (1<<((unit)%8))) != 0)
```

8.12.2.6 MB_UNITMAP_SET_BIT

```
#define MB_UNITMAP_SET_BIT(  
    unitmap,  
    unit,  
    value)
```

Value:

```
if (value)  
    ((uint8_t*)(unitmap))[(unit)/8] |= (1<<((unit)%8));  
else  
    ((uint8_t*)(unitmap))[(unit)/8] &= (~(1<<((unit)%8)));
```

8.12.2.7 SET_BIT

```
#define SET_BIT(  
    bitBuff,  
    bitNum,  
    value)
```

Value:

```
if (value)  
    \   
    ((uint8_t*)(bitBuff))[ (bitNum)/8 ] |= (1<<((bitNum)%8));  
else  
    \   
    ((uint8_t*)(bitBuff))[ (bitNum)/8 ] &= (~(1<<((bitNum)%8)));
```

Macro for set bit value with number `bitNum` to array `bitBuff`.

8.12.2.8 SET_BITS

```
#define SET_BITS(  
    bitBuff,  
    bitNum,  
    bitCount,  
    boolBuff)
```

Value:

```
for (uint16_t __i__ = 0; __i__ < bitCount; __i__++)  
    \   
    if (boolBuff[__i__])  
        \   
        ((uint8_t*)(bitBuff))[ ((bitNum)+__i__)/8 ] |= (1<<(((bitNum)+__i__)%8));  
    else  
        \   
        ((uint8_t*)(bitBuff))[ ((bitNum)+__i__)/8 ] &= (~(1<<(((bitNum)+__i__)%8)));
```

Macro for set bits begins with number `bitNum` with count from input bool array `boolBuff` to output bit array `bitBuff`.

8.12.2.9 StringLiteral

```
#define StringLiteral(  
    cstr)
```

Value:

`cstr`

Macro for creating string literal, must be used like: `StringLiteral("Some string")`

8.13 ModbusGlobal.h

8.14 C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusObject.h File Reference

The header file defines the class templates used to create signal/slot-like mechanism.

```
#include "Modbus.h"
```

Classes

- class [ModbusSlotBase< ReturnType, Args >](#)

- *ModbusSlotBase* base template for slot (method or function)
- class `ModbusSlotMethod< T, ReturnType, Args >`
ModbusSlotMethod template class hold pointer to object and its method
- class `ModbusSlotFunction< ReturnType, Args >`
ModbusSlotFunction template class hold pointer to slot function
- class `ModbusObject`
The *ModbusObject* class is the base class for objects that use signal/slot mechanism.

Typedefs

- `template<class T , class ReturnType , class ... Args>`
using **ModbusMethodPointer** = `ReturnType(T::*)(Args...)`
ModbusMethodPointer-pointer to class method template type
- `template<class ReturnType , class ... Args>`
using **ModbusFunctionPointer** = `ReturnType (*)(Args...)`
ModbusFunctionPointer pointer to function template type

8.14.1 Detailed Description

The header file defines the class templates used to create signal/slot-like mechanism.

8.20 C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusQt.h File Reference

Qt support file for ModbusLib.

```

#include "Modbus.h"
#include <QMetaEnum>
#include <QHash>
#include <QVariant>

```

Classes

- class [Modbus::Strings](#)
Sets constant key values for the map of settings.
- class [Modbus::Defaults](#)
Holds the default values of the settings.

Namespaces

- namespace [Modbus](#)
Main [Modbus](#) namespace. Contains classes, functions and constants to work with Modbus-protocol.

Typedefs

- typedef `QHash< QString, QVariant >` **Modbus::Settings**
Map for settings of [Modbus](#) protocol where key has type `QString` and value is `QVariant`.

Functions

- [MODBUS_EXPORT](#) [uint8_t](#) [Modbus::getSettingUnit](#) (const [Settings](#) &s, bool *ok=nullptr)
- [MODBUS_EXPORT](#) [ProtocolType](#) [Modbus::getSettingType](#) (const [Settings](#) &s, bool *ok=nullptr)

```

8.24 C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusSerialPort.h File Reference

Contains definition of base serial port class.

```
#include "ModbusPort.h"
```

Classes

- class [ModbusSerialPort](#)
The abstract class [ModbusSerialPort](#) is the base class serial port [Modbus](#) communications.
- struct [ModbusSerialPort::Defaults](#)
Holds the default values of the settings.

8.24.1 Detailed Description

Contains definition of base serial port class.

8.29 C:/Users/march/Dropbox/PRJ/ModbusLib/src/ModbusTcpPort.h File Reference

Header file of class `ModbusTcpPort`.

```
#include "ModbusPort.h"
```

Classes

- class `ModbusTcpPort`
Class `ModbusTcpPort` implements TCP version of `Modbus` protocol.
- struct `ModbusTcpPort::Defaults`
`Defaults` class contain default settings values for `ModbusTcpPort`.

8.29.1 Detailed Description

Header file of class `ModbusTcpPort`.
